Heat Pump Post-Forecast Adjustment

The sales forecast for the 2025 business plan and rate case continue to reflect a post-forecast adjustment to address the statewide Heat Pump Program instituted in Case 18-M-0084. For this forecast iteration, the forecast of program participants and annual cooling and heating kWh developed by Demand Side Analytics for the 2023 DSIP and utilized in the 2024 business plan was utilized as the basis for the heat pump forecast and was further adjusted to 1) reduce the forecast to account for historic growth embedded in the forecast as well as 2) assume additional growth related to new legislation limiting gas for heating purposes in certain new construction. Cost & Rate used this annual forecast, along with additional assumptions on existing heating source and customer type based on actual program participation, to develop a more granular monthly forecast as discussed below.

Participant Forecast

The projection of program participants by year developed by Demand Side Analytics was further adjusted to decrease the projected incremental growth in participants (and associated consumption) by a historic growth trend of 400 participants per year based on a three-year average of participant growth. Likewise, the projection of program participant growth was increased to account for customers who would have previously been included in the Company's forecast as new gas connections in a year but have been excluded from the gas customer forecast as a result of a change in legislation which limits gas connections for heating in certain new construction. These customers were instead assumed to be incremental heat pump program participants above the forecast growth in participants which was initially developed in 2023.

Existing Heating Source

An analysis of actual program participation determined the breakdown of existing heating source shown in Table 1 below as well as a breakdown of participating customer type of 93% residential and 7% non-residential.

Table 1: Existing Fuel Source

58%	oil
17%	gas
15%	propane
<u>10%</u>	electric
100%	

Electric Sales Impact

Incremental annual cooling and heating kWh, as projected by Demand Side Analytics, were allocated 93% to residential classes and 7% to non-residential based on actual program participation. Non-residential installations were assumed to be solely in the commercial non-demand class based on the size of customer typically installing such installations and given that this class makes up the largest non-residential forecasting group.

Incremental cooling load was assumed to impact only the cooling season months of May – October while incremental heating load was distributed amongst all months except July and August with the

monthly distribution of annual kWh impacts determined based on the annual distribution of normal billed degree days.

Gas Sales Impact

The 17% of participants who transitioned from gas were assumed to have an incremental impact on the gas sales forecast in addition to the incremental cooling and heating kWh impacts to the electric forecast. The same residential and non-residential split of 93%/7% was utilized to determine both the electric and gas impacts. Residential gas program participants were assumed to move from a heating to a non-heating profile and consumption level resulting in an overall decrease in annual gas sales to these customers. Non-residential gas program participants were assumed to shift away from a commercial heating profile and consumption level to a flatter, less heating-sensitive load shape consistent with a customer less reliant on gas as their heating source.

Summary of Results

By the end of the forecast period, 37,000, or nearly 14% of the residential electric customer population, is anticipated to be re-classified as heating and as a result would take on the usage characteristics and profile of a customer heating with electric. While the company projects a concomitant shift from gas heating to gas non-heating customers as 17% of program participants shift away from gas as their primary heating source, the company is not projecting any loss of gas customers and assumes all program participants will retain their gas service and continue as a gas customer.

Electric cooling load associated with heat pumps is projected to be lower than existing cooling load for the same customers as more efficient heat pumps replace less efficient and/or multiple window air conditioner units. The majority of the electric load changes are anticipated in the heating season, particularly as 90% of program participants will be adding electric heating load previously met by another fuel source. Incremental heat pump usage is anticipated to make up 9% of total electric consumption by 2029. Cumulative incremental MWh resulting from heat pump conversions is summarized Table 2, below.

Table 2: Cumulative MWh Impact of Heat Pump Program

Year	Cumulative MWh
2024	80,274
2025	134,891
2026	204,642
2027	285,343
2028	377,785
2029	480,724

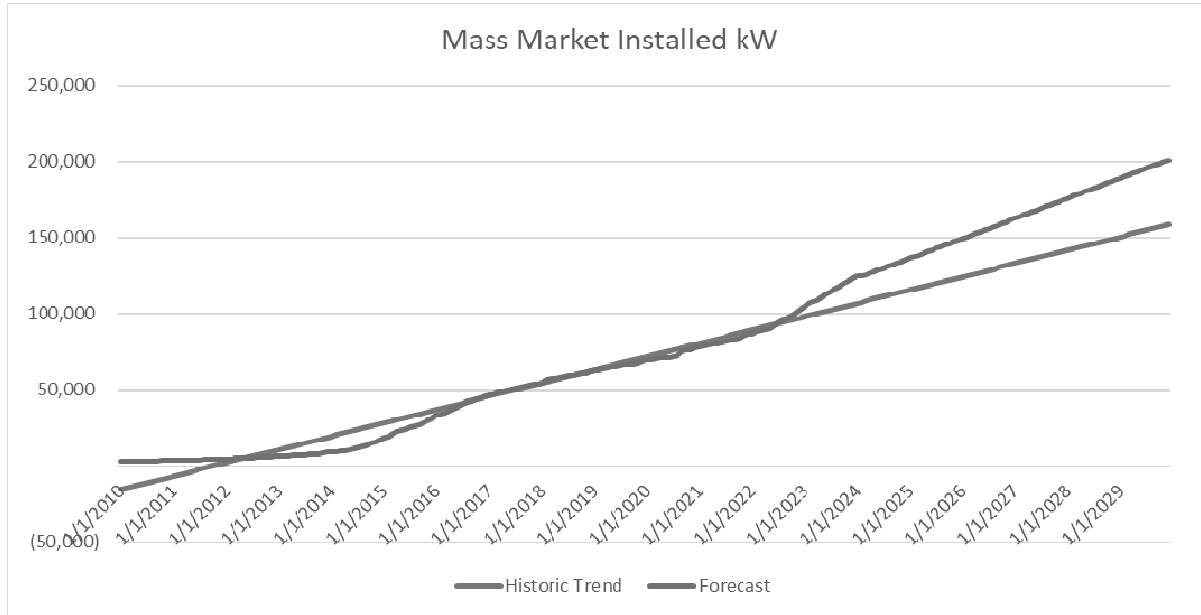

Overall, a reduction in gas usage is anticipated for the customer base converting from gas to heat pumps as their primary heating source. In total system-wide gas consumption resulting from heat pump installation is expected to reduce by 44,000 Mcf or 0.2% by 2029. Cumulative incremental Mcf resulting from heat pump conversions is summarized in Table 3, below.

Table 3: Cumulative Mcf Impact of Heat Pump Program

Year	Cumulative Mcf

*Includes MISC II.

**In order to only show the impact of base rate increases, bills under proposed rates do not reflect changes to the DLM VDER CR, SBC, EAM and RAM. These items have been included at current rates but are subject to change.

***The MFC Supply Charge includes 50 percent of forecast net lost revenues associated with customer migration and therefore is subject to change each year based on the calculation of actual net lost revenues. Current allocation of MFC Lost Revenue Charge included in Proposed MFC Supply.

Market Price Charge, Market Price Adjustment, and Miscellaneous Charges are included using a 12 month average of June 1, 2023 - May 31, 2024
