**2024 BASE RATE CASE FILING
(Volume III of V)**

FILED: April 2, 2024

FE PA STATEMENT NO. 7
Timothy Lyons

**BEFORE THE
PENNSYLVANIA PUBLIC UTILITY COMMISSION**

FIRSTENERGY PENNSYLVANIA ELECTRIC COMPANY

DOCKET NO. R-2024-3047068

**Direct Testimony
of
Timothy Lyons**

List of Topics Addressed

**Class Cost of Service
Rate Design
Cash Working Capital**

TABLE OF CONTENTS

I.	INTRODUCTION AND PURPOSE	1
II.	OVERVIEW	4
III.	ALLOCATED COST OF SERVICE STUDY	9
IV.	OVERVIEW OF RATE DESIGN	19
V.	PROPOSED RATE DESIGN	22
VI.	CASH WORKING CAPITAL REQUIREMENT	26
VII.	CONCLUSION.....	33

**DIRECT TESTIMONY
OF
TIMOTHY LYONS**

I. INTRODUCTION AND PURPOSE

Q. Please state your name and business address.

A. My name is Timothy S. Lyons. My business address is 3 Speen Street, Suite 150, Framingham, Massachusetts 01701.

Q. By whom are you employed and in what capacity?

A. I am a Partner with ScottMadden, Inc. ("ScottMadden").

Q. What is your work experience?

A. I have more than 30 years of experience in the energy industry. I started my career in 1985 at Boston Gas Company, eventually becoming Director of Rates and Revenue Analysis. In 1993, I moved to Providence Gas Company, eventually becoming Vice President of Marketing and Regulatory Affairs. Starting in 2001, I held several management consulting positions in the energy industry, first at KEMA and then at Quantec, LLC. In 2005, I became Vice President of Sales and Marketing at Vermont Gas Systems, Inc. before joining Sussex Economic Advisors, LLC ("Sussex") in 2013. Sussex was acquired by ScottMadden in 2016.

Q. What is your educational background?

A. I hold a bachelor's degree from St. Anselm College, a master's degree in economics from The Pennsylvania State University, and a master's degree in business administration from Babson College.

Q. Have you ever testified before the Pennsylvania Public Utility Commission (the “Commission”)?

A. No. However, I have sponsored testimony before 28 U.S. and three Canadian regulatory agencies. My testimony experience is summarized in Appendix A.

Q. On whose behalf are you testifying in this proceeding?

A. I am testifying on behalf of FirstEnergy Pennsylvania Electric Company (“FE PA” or the “Company”). FE PA consists of the following Rate Districts: Met-Ed, Penelec, Penn Power, West Penn, and The Pennsylvania State University (“PSU”) (collectively, the “Rate Districts”).¹

Q. What is the purpose of your Direct Testimony?

A. The purpose of my Direct Testimony is to sponsor the Company’s proposed electric distribution rates and cash working capital requirement. My Direct Testimony includes: (a) a description of the Class Cost of Service Study (“COSS”); (b) a description of the proposed revenue targets, rate design, and bill impact analyses for each rate class; and (c) a description of the lead-lag study used to calculate the Company’s cash working capital requirement. The COSS was used as a guide to develop the proposed electric distribution rates.

Q. Have you prepared exhibits supporting your testimony?

A. Yes. I am sponsoring the following exhibits:

- FE PA Exhibit TSL-1 – Class Cost of Service Study

¹ FE PA also has a sixth Rate District, the Waverly Rate District, which relates to FE PA’s New York jurisdictional rates.

- FE PA Exhibit TSL-2 –Rate Design and Bill Impacts
- FE PA Exhibit TSL-3 – Cost Curves
- FE PA Exhibit TSL-4 – Functionalization and Classification of Plant 364-368
- FE PA Exhibit TSL-5 – Lead-Lag Study

Exhibits TSL-1, TSL-2, and TSL-3 are organized into four sections with one for each Rate District. For example, FE PA Exhibit TSL-1 has four sections: (1) Met-Ed Rate District; (2) Penn Power Rate District; (3) Penelec Rate District; and (4) West Penn Rate District. The PSU Rate District is included in the West Penn Rate District.

I am responsible for the following base rate filing requirements.

Filing Requirement	Description	Location
IV-A-1	Summary of Revenues	Exhibit TSL-2
IV-A-2	Revenues under Current Rate Design	Exhibit TSL-2
IV-A-3	Revenues under Proposed Rate Design	Exhibit TSL-2
IV-A-4	Summary of Revenues	Exhibit TSL-2
IV-A-5	Summary of Revenues	Exhibit TSL-2
IV-B-4	Cash Working Capital	Exhibit TSL-5
IV-C	Proposed Rate Design	Exhibit TSL-2
IV-D-1	Customer Bill Impact Analysis	Exhibit TSL-2
IV-D-2	Customer Bill Impact Analysis	Exhibit TSL-2
IV-E-1	Class Cost of Service Study	Exhibit TSL-1
IV-E-2	Cost Curves	Exhibit TSL-3

II. OVERVIEW

Q. Please summarize your Direct Testimony.

A. The results of the Company's COSS show differences in class rates of return ("ROR") at current base rates as compared to the system or overall ROR, as shown in Figure 1 (below) for FE PA.

Figure 1: COSS Results (FE PA)

Figure 1 compares class RORs to the system or overall ROR at current base rates. The Figure shows certain rate classes, such as the residential class, yield RORs below the system ROR. The Figure also shows other rate classes yield RORs above the system ROR. The COSS results for each Rate District are summarized in FE PA Exhibit TSL-1.

Descriptions of the rate classes are included in Figure 2 (below).

Figure 2: Description of Rate Classes

Rate Schedule	Description
RS	Residential Service
GSV	General Service – Volunteer Fire
GSS	General Service – Small (Non-Demand)
GSM	General Service – Medium
GSL	General Service - Large
GP	General Service - Primary
TP	Transmission Power
PP 44	Primary Power Service
PP 46	Primary Power Service
MS	Municipal Service
POL	Private Outdoor Lighting
BDR	Borderline Service
STLT	Street Lighting Service
PSU	PSU Rate District

The Company's COSS was prepared generally consistent with methodologies used in the Company's most recent base rate case filing at Docket Nos. R-2016-2537349, *et al.*

The results of the COSS support a movement toward a more equitable rate structure where class RORs move closer to the system ROR. However, the proposed movement to the system ROR was moderated to address customer bill impact considerations.

The proposed distribution base rates reflect three important rate design principles: (a) rates should recover the overall cost of providing service; (b) rates should be fair, minimizing inter- and intra-class inequities to the extent possible; and (c) rate changes should be tempered by rate continuity concerns.

The proposed rate design generally reflects a uniform increase in kilowatt-hour ("kWh") usage charges, kilowatt ("kW") demand charges, and reactive ("rKVA") demand charges following increases in customer charges.

The Company prepared customer bill impacts to evaluate the impact of the proposed base rate changes. The bill impacts evaluated a wide range of customer usage. The customer bill impacts compare proposed total bills that include proposed base rates plus other charges to current total bills that include delivery rates² plus other charges.³

Overall, the proposed base rates increase monthly bills for residential customers using 1,000 kWh per month by the following amounts.

Figure 3: Proposed Monthly Bill Increases for Residential Customers

Residential Average Monthly Bill Increase	Proposed Bill		Current Bill		Increase / (Decrease) (\$)	Increase / (Decrease) (%)
Met-Ed Rate District	\$	205.00	\$	187.70	\$ 17.31	9.22%
Penelec Rate District	\$	220.75	\$	200.96	\$ 19.79	9.85%
Penn Power Rate District	\$	201.88	\$	180.59	\$ 21.30	11.79%
West Penn Rate District	\$	172.98	\$	156.36	\$ 16.61	10.62%

The bill impacts are summarized in FE PA Exhibit TSL-2 for each Rate District.

Q. Please describe the Company's service classifications.

A. FE PA provides electric service to approximately 2.1 million residential, commercial, and industrial ("C&I"), and lighting customers, as shown in Figure 4 (below).

² Current delivery rates include current base rates plus Smart Meter Technologies Charge Rider, Tax Cuts and Jobs Act Voluntary Surcharge Rider, State Tax Adjustment Surcharge Rider, and Distribution System Improvement Charge Rider. These charges are reflected in the proposed base rates.

³ Other charges not part of distribution base rates include Universal Service Cost Rider, Energy Efficiency and Conservation Charge Rider, Default Service Support Rider, Solar Photovoltaic Requirements Charge Rider, and the Price to Compare Default Service Rate Rider for those customers receiving default service.

Figure 4: Proforma Customers and Sales

FE PA Rate Classes	Number of Customers	% of Customers	Normalized Usage (MWh)	% Usage	kWh Use per Customer
RS	1,810,115	86.35%	19,120,384	37.75%	10,563
GSV	1,582	0.08%	44,953	0.09%	28,421
GSS	168,211	8.02%	614,667	1.21%	3,654
GSM	103,184	4.92%	9,683,509	19.12%	93,847
GSL	1,870	0.09%	4,176,972	8.25%	2,233,217
GP/TP	1,487	0.07%	15,556,697	30.71%	10,461,292
PP	4	0.00%	1,083,924	2.14%	265,879,612
POL	7,528	0.36%	41,281	0.08%	5,484
STLT	1,976	0.09%	82,867	0.16%	41,937
PSU	1	0.00%	217,652	0.43%	160,165,859
Other	363	0.02%	31,548	0.06%	87
Total	2,096,321	100.00%	50,654,454	100.00%	

The Figure shows FE PA serves, on average, approximately 1.8 million residential customers (86.35 percent), 0.3 million C&I customers (13.15 percent), and 10,000 lighting customers (0.50 percent).

Q. Please describe the characteristics of the service classifications.

A. Figure 4 (above) provides a breakdown of proforma customers and kWh sales by rate class. Proforma customers and kWh sales are based on the period January 1, 2025 through December 31, 2025.

Figure 4 shows variations in annual use per customer among the rate classes. RS customers, for example, use on average 10,563 kWh per year, while GSL customers use on average 2,233,217 kWh per year.

Figure 5 (below) shows monthly kWh sales by rate class as a percentage of annual kWh sales for that rate class. The Figure shows kWh sales vary seasonally for certain rate classes.

Figure 5: Monthly kWh Sales as % of Annual kWh Sales (FE PA)

The RS and GSS rate classes, for example, show a seasonal load pattern, with monthly sales increasing during the winter and summer months, reflecting heating and cooling use, respectively. The GSL and GP/TP rate classes show a relatively consistent load pattern throughout the year, with slight increases during the summer months. Load pattern differences, as discussed below, have implications on the allocation of costs in the COSS.

Q. Please describe the Company's current rate structure.

A. The current rate structure for each of the Company's Rate Districts consists of base rates and rider charges.⁴ The base rates include monthly customer charges, usage (kWh) charges, demand (kW) charges, and reactive (rKVA) charges.

⁴ The Company's tariffs are available at: [FEPA-Retail-Tariff \(firstenergycorp.com\)](https://www.firstenergycorp.com/FEPA-Retail-Tariff)

1 **III. ALLOCATED COST OF SERVICE STUDY**

2 **Q. What is the purpose of a COSS?**

3 A. The purpose of a COSS is to allocate a utility's overall cost of service to each rate class in
4 a manner that reflects its underlying cost of service. This approach is well established in
5 industry literature.⁵

6 **Q. What was the approach to develop the COSS for this case?**

7 A. The approach to develop the COSS was based on three steps. First, costs were
8 functionalized or assigned into functional categories. Next, functionalized costs were
9 classified into one of three cost drivers, based on whether the costs are related to: (1)
10 serving peak demands, (2) serving energy demands, or (3) meeting customer service
11 requirements. Finally, classified costs were allocated to each rate class based on methods
12 that best reflect how the costs are incurred.

13 The three steps were performed using two types of assignments: direct assignment
14 and indirect assignment. Direct assignments utilized the Company's financial data and
15 certain assignments of plant investments and expenses to certain functions, classifications,
16 and rate classes. Indirect assignments utilized composite allocators based on direct and
17 indirect assignments developed during the functionalization, classification, and allocation
18 process.

19 **Q. What is functionalization?**

20 A. Functionalization is the process of assigning rate base and expense items into operational
21 components. The functionalization of costs in the COSS was based on the Company's

⁵ See James C. Bonbright, et al., *Principles of Public Utility Rates* (2d ed. 1988).

accounting records, which are maintained in accordance with the Federal Energy Regulatory Commission's ("FERC") Uniform System of Accounts ("USOA").

Q. What is classification?

A. Classification is the process of assigning rate base and expense items into categories that reflect cost-causation. There are three principle causes or drivers of costs related to the electric system:

- Customer-related – costs that vary with the number of customers, such as costs associated with connecting customers to the electric system and providing basic customer services (*e.g.*, metering and billing);
- Demand-related – costs that vary with maximum customer demands at the time of the system peak, at the time of the rate class peak, or at the time of the individual customer peak; and
- Energy-related – costs that vary with production, transmission, and/or delivery of energy, such as fuel and purchased power expenses.⁶

Q. What is allocation?

A. Allocation is the process of assigning rate base and expense items to each rate class based on allocators that best reflect how the costs were incurred. In other words, cost allocation follows how costs are incurred.

Q. What types of allocators were used to develop the COSS?

A. There were three types of allocators used to develop the COSS:

⁶ The COSS classified costs as customer or demand since the COSS reflects only distribution costs. The primary drivers of distribution costs are customers and demands.

- 1 • Class determinants – class characteristics, such as number of customers, kW peak
- 2 demands, kWh sales, and revenues by rate class;
- 3 • Special studies – detailed analysis of specific plant or expense items, such as
- 4 meters; and
- 5 • Indirect – composite allocators based on how other costs were allocated.

6 **Q. What was the approach used to develop the COSS for this rate case filing?**

7 A. The COSS for each Rate District was based on a model developed specifically for this
8 filing. Rate base and expense items in the COSS were assigned to each rate class based on
9 the three-step process described above. The results of the COSS are included in FE PA
10 Exhibit TSL-1.

11 **Q. What conclusions can be reached when rate classes yield RORs lower or higher than**
12 **the system ROR?**

13 A. If rate classes yield RORs lower than the system ROR, then revenues recovered from the
14 rate classes are less than their cost of service. Conversely, if rate classes yield RORs higher
15 than the system ROR, then revenues recovered from the rate classes are more than their
16 cost of service. As discussed below, the COSS results were used to guide development of
17 revenue targets for each rate class, subject to bill continuity concerns, that move the
18 Company's proposed rates in aggregate closer to the system ROR to achieve more fair and
19 equitable rates across customer classes.

20 **Q. What data was used to prepare the COSS?**

21 A. The COSS was based on the proforma year January 1, 2025, through December 31, 2025.
22 The COSS includes the number of customers, sales, and revenues by rate class. The COSS

also includes rate base items, including intangible plant, distribution, and general plant-in-service as well as: (a) additions to rate base, such as working capital, and (b) reductions to rate base, such as accumulated depreciation. The COSS also includes operations and maintenance (“O&M”) expenses, including distribution, customer service, customer account, sales, and administrative and general (“A&G”) expenses as well as taxes other than income, such as payroll and property taxes, and income taxes.

Q. What was the approach to functionalize costs in the COSS?

A. As discussed earlier, functionalization is an important first step in developing the COSS. The functionalization process in this study generally followed the USOA. However, distribution plant was further functionalized into substation, primary, and secondary distribution facilities to ensure that the cost of service at these functional levels was separately identified and applied.

Specifically, the overall cost of service was functionalized into one of the following categories:

- Sub-transmission – plant investment and expenses associated with the Company’s sub-transmission facilities. These include sub-transmission plant, accumulated depreciation, depreciation expense, and related O&M expenses.
- Primary Distribution – plant investment and expenses associated with the Company’s primary voltage distribution facilities. These include primary distribution plant, accumulated depreciation, depreciation expense, and related O&M expenses. Some costs that support both the primary and secondary distribution systems were functionalized into primary and secondary functions.

Such costs include poles and towers, overhead conductors and devices, underground conduit, and underground conductors and devices.

- Secondary Distribution – plant investment and expenses associated with the Company’s secondary voltage distribution facilities. These include secondary distribution plant, accumulated depreciation, depreciation expense, and related O&M expenses. The secondary portion of poles and towers, overhead conductors and devices, underground conduit, and underground conductors and devices are also included in this function.
- Customer Service – plant investment and expenses associated with the Company’s customer service facilities. These costs are largely related to customer service, customer accounts, and sales expenses.

The remaining plant investments were assigned to one of the functional categories based on composite functionalization of the plant accounts. For example, general plant and labor-related A&G expenses were assigned to the functional categories based on the composite functionalization of labor-related distribution expenses.

In addition, the distribution O&M expenses were assigned to one of the functional categories based on functionalization of the relevant distribution plant accounts. For example, the overhead line O&M costs (Account 583) were functionalized based on overhead plant (Account 365).

Q. What was the approach to classify costs in the COSS?

A. The COSS classified costs into one of the following three categories:

- 1 • Customer – costs associated with providing customers access to the electric system
- 2 as well as providing ongoing customer services, such as meter reading and billing
- 3 services.
- 4 • Demand – costs associated with meeting customer peak demand requirements.
- 5 • Energy – costs associated with meeting customer energy requirements.

6 **Q. What was the approach to classify distribution plant?**

7 A. Distribution plant represents the largest portion of the Company’s investment in utility
 8 plant. The classification of distribution plant reflects two primary cost drivers. The first
 9 cost driver is the number of customers, *i.e.*, distribution facilities are designed to provide
 10 customer access to the electric system. The second driver is peak and energy demands,
 11 *i.e.*, distribution facilities are designed to meet customer peak and energy demands
 12 throughout the year. This approach to classification of distribution facilities is well-
 13 established and recognized by the National Association of Regulatory Commissioners
 14 (“NARUC”). Specifically, NARUC’s Electric Utility Cost Allocation Manual (the
 15 “NARUC Manual”) provides:

16 Distribution plant Accounts 364 through 370 involve demand and customer
 17 costs. The customer component of distribution facilities is that portion of
 18 costs which varies with the number of customers. Thus, the number of
 19 poles, conductors, transformers, services and meters are directly related to
 20 the number of customers on the utility’s system. . . . [E]ach primary plant
 21 account can be separately classified into demand and customer component.⁷

22 The classification of distribution plant in this study is consistent with the approach
 23 described in the NARUC Manual.

⁷ NARUC, *Electric Utility Cost Allocation Manual* 90 (1992).

Specifically, Distribution plant accounts were classified based on their specific functions.

For distribution plant related to substations (FERC Account 362), the plant was classified as demand and allocated to each rate class based on Non-Coincident Peak (“NCP”) demands.

Q. What was the approach to classify plant accounts 364-368?

A. Plant accounts 364-368 were classified based on the “minimum-size” method. It is one of the methods recognized by NARUC to classify plant accounts 364-368.

The minimum-size method represents the cost of connecting customers to the system to serve minimum demands. The minimum-size method assumes that a minimum size distribution system can be built to serve minimum demand requirements of customers. The “minimum system” costs are classified as customer-related, while distribution plant in excess of the minimum system reflects the cost of serving customer peak demands and is classified as demand-related. The approach is described in the NARUC Manual:

Classifying distribution plant with the minimum-size method assumes that a minimum size distribution system can be built to serve the minimum loading requirements of the customer. The minimum-size method involves determining the minimum size pole, conductor, cable, transformer, and service that is currently installed by the utility.⁸

The minimum-size method utilized the Company’s installed costs for each plant account adjusted for current dollars utilizing the Handy-Whitman Index of Public Utility Construction Costs.

⁸ *Ibid.*

Q. What were the results of the minimum-size method?

A. The results of the minimum-size method are summarized in Figure 6 (below).

Figure 6: Classification of Distribution Plant

Distribution Plant Classification	Met-Ed	Penelec	Penn Power	West Penn
Customer-related Classification				
Acct. 364 Poles, Towers & Fixtures	72.12%	71.03%	77.62%	79.45%
Acct. 365 Overhead Conductors & Devices	95.12%	94.78%	97.46%	97.92%
Acct. 366 Underground Conduit	0.00%	0.00%	0.00%	0.00%
Acct. 367 Underground Conductors & Device	93.18%	91.72%	91.99%	78.23%
Acct. 368 Line Transformers	54.51%	75.77%	67.77%	81.49%
Acct. 369 Services	100.00%	100.00%	100.00%	100.00%
Acct. 370 Meters	100.00%	100.00%	100.00%	100.00%
Demand-related Classification				
Acct. 364 Poles, Towers & Fixtures	27.88%	28.97%	22.38%	20.55%
Acct. 365 Overhead Conductors & Devices	4.88%	5.22%	2.54%	2.08%
Acct. 366 Underground Conduit	100.00%	100.00%	100.00%	100.00%
Acct. 367 Underground Conductors & Device	6.82%	8.28%	8.01%	21.77%
Acct. 368 Line Transformers	45.49%	24.23%	32.23%	18.51%
Acct. 369 Services	0.00%	0.00%	0.00%	0.00%
Acct. 370 Meters	0.00%	0.00%	0.00%	0.00%

The Figure shows distribution plant (Accounts 364-370) are classified as customer and demand. The Company classified Underground Conduits (Account 366) costs as demand since the Company installs underground conduit for purposes of serving demand and not to connect customers to the electric grid.

Q. How were other plant items classified?

A. Other plant items were similarly classified based on their underlying cost drivers. Rate base items not directly associated with one of the classification categories, such as intangible plant, were classified through a composite classifier.

1 **Q. What was the classification process for O&M expenses?**

2 A. Distribution O&M expenses were classified in a manner similar to the respective plant
3 items. Classification of overhead line O&M costs (Account 583), for example, was based
4 on classification of overhead plant (Account 365).

5 O&M expense items not directly associated with one of the classification
6 categories, such as non-labor related A&G expenses, were classified through a composite
7 classifier.

8 **Q. Please describe the allocation process used in developing the COSS.**

9 A. Costs were allocated to each rate class based on how costs are incurred to serve that class.
10 In other words, for each component of cost, the Company developed an allocator that best
11 reflects how costs are incurred.

12 **Q. Please describe the allocators used in developing the COSS.**

13 A. The COSS was based on three types of allocators:

- 14 • Class determinants – class characteristics, such as number of customers, peak demands,
15 kWh sales, and revenues by rate class;
- 16 • Special studies – detailed analysis of specific plant or expense items, such as meters
17 and uncollectible expenses; and
- 18 • Indirect – composite allocators based on how other costs are allocated.

19 **Q. How was distribution plant allocated?**

20 A. Distribution plant was allocated to each rate class consistent with its design objectives to
21 meet peak demand requirements. Specifically, distribution plant was allocated to each rate
22 class based on NCP demands.

1 **Q. How was meter plant allocated?**

2 A. Meter plant was allocated to each rate class based on the results of a study that estimates
3 the cost of meter and meter installation for each rate class.

4 **Q. Please describe the process to develop the composite allocators.**

5 A. There are several composite allocators developed internally based on the allocation of
6 various plant investments and expenses. These are used to allocate cost items that cannot
7 be readily categorized. For example, general plant is allocated based on the composite
8 allocation of all labor-related distribution, customer accounts, and customer service O&M
9 expenses.

10 **Q. How were O&M expenses allocated to each rate class?**

11 A. O&M expenses were allocated to each rate class consistent with their respective plant
12 accounts. For example, allocation of overhead line O&M costs (Account 583) was based
13 on allocation of overhead plant (Account 365).

14 **Q. Does the cost of service vary across the Company's rate classes?**

15 A. Yes, the cost of service per customer and per kWh (*i.e.*, unit cost of service) varies across
16 the Company's rate classes, as shown in Figure 7 (below).

Figure 7: Unit Cost of Service by Rate Class

Rate Class	Class Revenue Requirements	
	\$ per Customer	\$ per kWh
RS	\$ 842	\$ 0.080
GSV	\$ 1,176	\$ 0.041
GSS	\$ 761	\$ 0.208
GSM	\$ 2,017	\$ 0.021
GSL	\$ 26,229	\$ 0.012
GP/TP	\$ 66,642	\$ 0.006
PP44/PP46	\$ 1,260,383	\$ 0.005
POL	\$ 1,199	\$ 0.219
STLT	\$ 23,160	\$ 0.552
PSU	\$ 1,064,600	\$ 0.007
Other	\$ 3,062	\$ 0.035

The Figure shows, for example, the unit cost of service for the RS rate class is \$842 per customer, while the unit cost of service for the GSL rate class is \$26,229 per customer. By comparison, the unit cost of service for the RS rate class is \$0.080 per kWh, while the unit cost of service for the GSL rate class is \$0.012 per kWh.

Q. How are variations in the unit cost of service used to support the Company's rate design?

A. Variations in the unit cost of service support the need for distinct rate classes and rate designs.

IV. OVERVIEW OF RATE DESIGN

Q. Please describe the principles used to guide the proposed rate design.

A. The proposed rate design was guided by several principles commonly used throughout the industry, including: (a) rates should recover the overall cost of providing service; (b) rates

1 should be fair, minimizing inter- and intra-class inequities to the extent possible; and (c)
2 rate changes should be tempered by rate continuity concerns.⁹

3 Because these principles can conflict, the proposed rate design reflects a level of
4 judgment to balance these principles.

5 **Q. How were these principles applied in this proceeding?**

6 A. First, rates were designed to recover the overall cost of service. This was done by
7 developing customer, demand, and energy charges based on proforma bills, kW billing
8 demands, and kWh sales. In addition, rates were designed to be fair and equitable. This
9 was done by setting revenue targets for each rate class that reflect in aggregate a movement
10 toward the system ROR based on the results of the COSS. Specifically, the results of the
11 COSS show some rate classes yield RORs less than the system ROR. The proposed rate
12 design reduces that difference by proposing rate increases for those rate classes that are
13 higher than the system average. Another rate design objective is to moderate rate changes
14 to address rate continuity concerns. This objective was considered while setting revenue
15 targets and then again while setting rate elements.

16 **Q. Please summarize the steps taken to develop the proposed rates.**

17 A. The first step to develop the proposed rates was to establish the overall revenue requirement
18 to be recovered from base distribution rates. The next step was to set revenue targets for
19 each rate class based on the results of the COSS, moderated by rate continuity concerns.
20 Rates within each rate class were then designed to recover the revenue targets based on
21 proforma bills, kW demands, reactive rKVA demands, and kWh usage data.

⁹ James C. Bonbright, et al., *Principles of Public Utility Rates* 377-407 (2d ed. 1988).

Q. What is the total revenue requirement used as a starting point?

A. The total revenue requirement used as a starting point is included in the testimony and exhibits of Company witness Larkin (FE PA Statement No. 3), which indicates an increase in the FE PA revenue requirement of \$503.8 million, of which approximately \$1.4 million is from a forecasted increase in other revenue. The proposed revenue is presented in Figure 8 below.

Figure 8: Proposed Revenue Increase

Revenue Summary (\$ in Thousands)	Proposed Revenues	Current Revenues	Increase / (Decrease) (\$)	Increase / (Decrease) (%)
Met-Ed Rate District	\$ 642,308	\$ 495,976	\$ 146,332	29.5%
Penelec Rate District	629,767	496,804	132,963	26.8%
Penn Power Rate District	187,186	132,422	54,764	41.4%
West Penn Rate District	614,232	444,442	169,789	38.2%
Total First Energy PA	\$ 2,073,493	\$ 1,569,644	\$ 503,849	32.1%

Q. Please describe the process to set the revenue targets for each rate class.

A. Since each rate class currently yields an ROR that is different than the system ROR, the starting point for setting the revenue targets was to compare current class revenues to class revenues at equalized rates of return.

Q. In general, how did you determine the appropriate rate design within each rate class?

A. The proposed rates were designed by first ensuring the rates recover the proposed revenue target for each rate class. The proposed rates were then designed to reflect a uniform increase in sales (kWh) charges, demand (kW) charges, and reactive demand (rKVA) charges following increases in customer charges. The results of the rate design are included in FE PA Exhibit TSL-2.

1 **V. PROPOSED RATE DESIGN**

2 **Q. Please describe the process used to set the revenue requirement targets for each rate**
3 **class.**

4 A. The starting point for setting the class revenue targets was first identifying the base rate
5 changes necessary to achieve equalized rates of return for all rate classes. For those rate
6 classes that yield RORs less than the system ROR, the rate increases necessary to move
7 toward the system ROR were higher relative to the system average; however, the
8 movement to the system ROR was moderated by bill continuity considerations.

9 Specifically, to mitigate bill impact concerns, the proposed revenue targets for each
10 rate class were based on a 10.00 percent movement toward the system ROR, as shown in
11 FE PA Exhibit TSL-2.

12 The Exhibit shows revenue requirements for each rate class based on three
13 approaches to setting class revenue targets: (1) a full movement to system ROR; (2) a
14 uniform increase in revenues; and (3) a partial movement to system ROR, which is the
15 Company's proposal.

16 A full movement to system ROR for certain rate classes would result in significant
17 increases for certain rate classes, thus raising bill continuity concerns. A uniform increase
18 across all rate classes would address bill continuity concerns but raise fairness concerns
19 since there would be no movement to system ROR. The Company's proposed revenue
20 targets reflect a balance of fairness and bill continuity considerations.

21 The Company believes a 10.00 percent movement to system ROR strikes an
22 appropriate balance between moving to cost-based rates (full movement to system ROR)
23 and addressing rate continuity considerations (uniform increase in revenues).

Q. Please describe the process to set the proposed base rates for each rate class.

A. To mitigate bill impact concerns, the proposed rates for each rate class were generally based on a uniform increase in sales (kWh) charges, demand (kW) charges, and reactive demand (rKVA) charges following increases in customer charges.

Q. What are the proposed base rates for Schedule RS, the residential class?

A. The Company's proposed base rates for Schedule RS are presented in Figure 9 (below).

Figure 9: Proposed Schedule RS Base Rates

Q. What are the proposed base rates for the other rate schedules?

A. The Company's proposed base rates for the other rate schedules are presented in FE PA Exhibit TSL-2.

VI. CASH WORKING CAPITAL REQUIREMENT

Q. What is the term "Working Capital" as a component of rate base?

A. The term "working capital" refers to the net funds required by the Company to finance goods and services used to provide service to customers from the time those goods and services are paid for by the Company to the time that payment is received from customers. Goods and services considered in the lead-lag study include O&M expenses, including labor and non-labor expenses, federal, state, and local taxes, and employment taxes.

Q. How was the Company's cash working capital requirement derived?

A. The Company's cash working capital requirement was derived by applying the results of the lead-lag study to the Company's adjusted projected test year expenses. The lead-lag study compares differences between the Company's revenue lag and expense leads.

The revenue lag represents the number of days from the time customers receive their electric service to the time customers pay for their electric service, *i.e.*, when the funds are available to the Company. The longer the revenue lag, the more cash the Company needs to finance its day-to-day operations.

The expense lead represents the number of days from the time the Company receives goods and services used to provide electric service to the time payments are made for those goods and services, *i.e.*, when the funds are no longer available to the Company.

1 The longer the expense lead, the less cash the Company needs to fund its day-to-day
2 operations.

3 Together, the revenue lag and expense leads are used to measure the lead-lag days.
4 The lead-lag days are then applied to the Company's adjusted test year expenses to derive
5 the cash working capital requirement, which is included in the Company's rate base.

6 **Q. What was the data used in the lead-lag study?**

7 A. The lead-lag study was based on data from the period October 1, 2022, through September
8 30, 2023 ("study period"). The data included: customer meter reading and billing
9 schedules; O&M expenses; and federal, state, local, and employment taxes. The data
10 generally included service periods, payment dates, and payment amounts.

11 **Q. How was the revenue lag derived?**

12 A. The revenue lag was based on the number of days from the time electric service was
13 provided to customers to the time payment was received from customers. There are two
14 categories of revenues that comprise the revenue lag: (1) retail electric revenues, and (2)
15 other revenues.

16 Retail electric revenues represent the largest revenue category, consisting of
17 revenues related to retail electric service for residential, commercial, public streetlights,
18 and industrial customers. The revenue lag for retail electric service was measured as the
19 sum of three components: (1) the service lag; (2) the billing lag; and (3) the collection lag.

20 **Q. What is the service lag?**

21 A. The service lag measures the average number of days in the service period, *i.e.*, the time
22 between the start and end of the billing month. The service lag in this lead-lag study was

based on the midpoint of the service period, which reflects that electricity is delivered evenly over the service period.

Q. What is the billing lag?

A. The billing lag measures the number of days from the time meters are read to the time bills are calculated and recorded. The billing lag in this lead-lag study was based on the Company's meter reading schedule.

Q. What is the collection lag?

A. The collection lag measures the number of days from the time bills are calculated and recorded to the time customer payments are received (*i.e.*, funds are available to the Company). The collection lag in this lead-lag study was based on monthly accounts receivable balances and billed revenue data. Specifically, the collection lag was determined by dividing the average accounts receivable balance during the study period by the average billed revenues per day during the same period.

Q. How was the revenue lag for other operating revenues derived?

A. The revenue lag for other operating revenues was derived by first identifying the revenue lag for each category of other revenues, second converting the revenue lags to "dollar-days" that reflect a weighting of the categories by revenues, and finally summing the dollar days across all other operating revenues. Other revenues include: (1) sales for resale; (2) late payment charges; (3) pole rentals; and (4) other.

1 **Q. What is the total revenue lag used in the lead-lag study?**

2 A. The total revenue lag used in the lead-lag study is based on a weighted average of the
3 revenue lags for retail electricity revenues and other operating revenues. The derivation of
4 the revenue lag is shown in Exhibit TSL-5.

5 **Q. How were lead days for O&M expenses derived?**

6 A. Lead days for O&M expenses were measured separately for the following expense
7 categories: (1) energy purchases; (2) payroll expenses; (3) employee benefits; (4)
8 Commission annual assessment; (5) FirstEnergy Service (Affiliate) Company; and (6)
9 other O&M expenses.

10 **Q. How were lead days for energy purchases derived?**

11 A. Lead days for energy purchases were based on a review of the Company's invoices. Lead
12 days were measured as the number of days from the midpoint of the service period to the
13 payment date.

14 **Q. How were lead days for payroll expenses derived?**

15 A. Lead days for payroll expenses were based on the Company's payroll process, which pays
16 employees either on a weekly and bi-weekly basis. Lead days were measured for each
17 payroll period as the number of days from the midpoint of the weekly and bi-weekly payroll
18 period, individually, to the weekly and bi-weekly payment date, converted to "dollar-days"
19 to reflect a weighting of the expense amounts, and then summed across all regular payroll
20 expenses.

1 **Q. How were lead days for employee benefit expenses derived?**

2 A. Lead days for employee benefit expenses were based on a review of the Company's
3 payments for individual benefit items, including medical, life insurance, and 401(k) plans.
4 Lead days were measured for each benefit item as the number of days from the midpoint
5 of the benefit period to the payment date, converted to "dollar-days" to reflect a weighting
6 of the expense amounts, and then summed across all benefit expenses.

7 **Q. How were lead days for Commission annual assessment fees derived?**

8 A. Lead days for the Commission annual assessment fees were measured as the number of
9 days from the midpoint of the assessment period to the payment date.

10 **Q. How were lead days for FirstEnergy Service Company (Affiliate) expenses derived?**

11 A. Lead days for the FirstEnergy Service Company (Affiliate) ("FESC") expenses were based
12 on the number of days from the midpoint of the service period to the financial settlement
13 (payment) date via the money pool. The FESC service period is based on the calendar
14 month. Intercompany charges are recorded during the month, and they are billed by FESC
15 and settled by the various FirstEnergy companies on the first business day following the
16 conclusion of the service period. Lead days for FESC expenses were measured as the
17 number of days from the midpoint of the service period to the financial settlement via the
18 money pool, which is on the first business day following the conclusion of the service
19 period.

Q. How were lead days determined for other O&M expenses?

A. Lead days for other O&M expenses were based on the sum of two components: (1) lead days from the midpoint of the service period to the invoice date; and (2) lead days from the invoice date to the payment date.

Lead days from the midpoint of the service period to the invoice date were based on a stratified sample of invoices paid by the Company over the period October 1, 2022, through September 30, 2023. Lead days were measured for each invoice in the sample as the number of days from the midpoint of the service period to the invoice date. Invoices were then converted to “dollar days” to reflect a weighting by expense amount and then summed by invoice amounts to determine the lead days. The study relied on a sample of invoices to measure the lead days because the service periods were not readily available electronically and required detailed inspection of individual invoices.

Lead days from the invoice date to the payment date were based on the full population of invoices paid by the Company over the period October 1, 2022, through September 30, 2023. Lead days were measured for each invoice as the number of days from the invoice date to the payment date. Invoices were then converted to “dollar days” to reflect a weighting by expense amount and then summed by invoice amounts to determine the lead days.

Q. How were lead days for federal income tax derived?

A. Lead days for federal income taxes were based on due dates for tax payments: April 15, June 15, September 15, and December 15. Lead days for federal income taxes were measured as the number of days from the midpoint of the taxing period (*i.e.*, the calendar year) to the due dates. The study assumes the tax payments reflect equal installments.

Q. How were lead days for state income tax derived?

A. Lead days for state income taxes were based on due dates for tax payments: March 15, June 15, September 15, and December 15. Lead days for state income taxes were measured as the number of days from the midpoint of the taxing period (*i.e.*, the calendar year) to the due dates. The study assumes the tax payments reflect equal installments.

Q. How were lead days for taxes other than income taxes derived?

A. Lead days for taxes other than income taxes were measured separately for the following categories: (1) payroll-related taxes (Federal Insurance Contributions Act (“FICA”), federal unemployment, and state unemployment); (2) property taxes; (3) gross receipt taxes; (4) public utility realty tax; and (5) sales and use taxes.

Q. How were lead days for each of these taxes derived?

A. Lead days for FICA taxes were measured as the number of days from the payroll payment date of the applicable pay period to the FICA payment date plus the payroll lead days.

Lead days for federal and state unemployment taxes were measured as 30 days after the end of each quarter. These taxes were then converted to “dollar days” to reflect a weighting by expense amount and then summed by payment amounts to determine the lead days.

Lead days for property taxes were measured as the number of days from the midpoint of the taxing period to the payment date. These taxes were then converted to “dollar days” to reflect a weighting by expense amount and then summed by payment amounts to determine the lead days.

Lead days for gross receipts, public utility realty tax, and sales and use taxes were measured as the number of days from the midpoint of the taxing period to the payment

1 date. These taxes were then converted to “dollar days” to reflect a weighting by expense
2 amount and then summed by payment amounts to determine the lead days.

3 **Q. How were lead days for interest payments derived?**

4 A. Lead days for interest payments related to long-term debt were measured as the number of
5 days from the midpoint of the service period to the payment date for the study period.
6 These interest payments were then converted to “dollar days” to reflect a weighting by
7 expense amount and then summed by payment amounts to determine the lead days.

8 Lead days for interest on customer deposits were measured as the midpoint of the
9 service period of one year for RS customers and of the service period of two years for Non-
10 RS customers.

11 **Q. Does the cash working capital requirement reflect any other adjustments?**

12 A. Yes. The cash working capital requirement reflects an adjustment for prepayments to
13 reflect 13-month average balances.

14 **Q. What were the results of the lead-lag study?**

15 A. The results of the lead-lag study are included in FE PA Exhibit TSL-5.

16 **VII. CONCLUSION**

17 **Q. Does this conclude your direct testimony?**

18 A. Yes, it does.

SCOPE

This report looks at two concepts, the allocation of certain distribution plant accounts to a customer cost (aka “minimum grid”) or demand costs, here after referred to as the Customer Cost Study, and the allocation of certain distribution costs to customers served as primary voltage accounts. NARUC describes the basics of Customer Costs Studies in their publication “Electric Utility Cost Allocation Manual¹,” but the basics of these studies are to serve the purpose of allocating utility costs and/or asset values to different classes of customers.

Customer Cost Study

The Customer Cost Study is designed to separate the asset values into component costs, as follows;

- Customer Related Costs
- Demand Related Costs
- Energy Related Costs

The costs of the distribution system are primarily impacted by demand and the number of customers, so this study serves the purpose of allocating utility costs and/or asset values to those two cost components². The plant accounts considered in this study are:

- FERC Account 364 – POLES, TOWERS, AND FIXTURES
- FERC Account 365 – OVERHEAD CONDUCTORS & DEVICES
- FERC Account 367 – UNDERGROUND C ONDUCTORS & DEVICES
- FERC Account 368 – LINE TRANSFORMERS

Primary/Secondary Customer Cost Study

The primary/secondary customer cost study is aimed at determining the portion of the distribution assets that are used to serve primary voltage customers; for example, the distribution transformer, secondary conductor, and service conductor types of distribution plant are not used to serve these customers. Similarly some accounts have limited assets that are used to provide service to these primary service customers; the Primary/Secondary Customer Cost Study is designed to determine the extent of each of those accounts used by the Primary Voltage Customer³. The accounts considered in this study are:

DEFINITIONS AND TERMS

A number of large data bases house the information used in the preparation of this report. The following definitions and terms describe: those systems and applications, from which data was extracted; the software tools used to extract, analyze, and summarize that information; and finally references are provided to any external data sources used.

Company Computer Systems, Data and Processes

The Company has a number of computer systems that house data used for this study. As utilities have grown, so has the size and complexity of these systems leading to the need to use software tools like SQL queries to analyze data sets that can no-longer be effectively analyzed using common desktop tools like Excel.

CCS

The Company's CCS or "Customer Care System" is the customer accounting and billing system. With data contained in this system the Company is able to tell the type of customer; the customer's customer rate code. The GIS and CCS customer records are connected through connection object database keys, which enable the Company to determine where, on the geographically represented system, each customer, and customer type, is connected. The CCS is a sub-system of SAP (see SAP below).

CREWS

CREWS is FirstEnergy's work management system, used by the Operating Companies to perform engineering estimates for construction work.

GIS

The Company's GIS or "Geographical Information System" is the computer system providing a geographically referenced, asset database of the installed distribution plant information, including information on poles, primary conductors, fuses, transformers, and switches, and how those pieces of the electric distribution system are electrically interconnected from the substation to the customer. The GIS is used primarily for mapping and detailing the distribution system aiding engineering design, planning and troubleshooting tasks.

Pennsylvania Rate Case

SAP

SAP⁴ offers bundles of applications and services to enable companies to manage their businesses. These applications can include customer care systems (CCS), billing, financial, purchasing, inventory, and human resources functions.

Software Tools

SQL

Structured Query Language (SQL)⁵ is a special programming language designed to manage and extract data held in a relational data base management system (RDBS), like Oracle, Sybase, MySQL, or, Microsoft SQL Server. Most of the Company's data bases, used for the preparation of this report, are Oracle RDBSs.

Toad Data Point

Toad Data Point, by Quest Software Inc⁶, a cross-platform, self-service, data-integration tool that simplifies data access, preparation and provisioning. FirstEnergy uses Toad Data Point for general SQL execution and Data Cleaning as it pertains to studies on large datasets.

Microsoft Excel

Excel, by Microsoft⁷, is a general use spreadsheet application. The software has functions allowing calculations, graphing, and aggregating data through use of pivot tables.

External Data Sources

Handy-Whitman Index

The *Handy-Whitman Index of Public Utility Construction*⁸ provides asset price indexes and the capital book value against a benchmark year. Handy-Whitman Index numbers serve as a yardstick to estimate the impact of fluctuations in the value of material and labor costs, allowing assets of a known age to be reflected in other years. Average prices and cost trends are used to develop the Handy-Whitman Index. This Index is commonly used by utilities and regulators in their calculations of rate base for rate cases and in their valuations of property for insurance purposes.

Electric Utility Cost Allocation Manual⁹

The Electric Utility Cost Allocation Manual, by NARUC, was written by a team of utility, public utility commission, and FERC representatives and provides frameworks for costs of service studies. Section II of this Manual contains five chapters that explain the dominant method of cost allocation - the embedded cost study, which is based upon historical or known utility costs. Areas covered are production costs, transmission costs, distribution costs and the classification and allocation of customer-related costs and investments.

⁹ National Association of Regulatory Utility Commissions (NARUC). *Electric Utility Cost Allocation Manual*, 1992.

FERC Account 364 – POLES, TOWERS, AND FIXTURES

This plant distribution account is predominately made up of the various wood distribution poles used to support primary and secondary distribution conductors.

Assumptions and Method

- The Company's GIS was used to determine the number of wood distribution poles, by size and install year. In the analysis, these poles were replaced by the minimum size wood distribution poles that have seen common use within the study territory; 35-foot poles for those supporting primary conductors without joint use underbuild.
 - Poles without an install year were omitted
 - Poles with install years < 1912 were omitted
 - Only poles supporting primary conductor were included (i.e., street-light and secondary only poles were omitted).
 - Only poles where POLE_MAT in (D, L, M, N, P, R, W, Z) were considered ... the other materials are fiberglass, steel, concrete, aluminum, etc. materials that are unlikely for "distribution" poles.
 - Only poles where HEIGHT in (25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, & 95) were considered, the other pole heights typically indicate either street-light only poles, i.e., HEIGHT in (12, 15, 16, 17, 20, 27) or may reflect erroneous data.
- The current installed cost for each size pole was obtained from CREWS, and trended by size to build a list of costs by pole length for each size wood pole.
- The install years were used to age the current costs for the actual size and minimum size transformers using Handy-Whitman indices, and extended by the number of poles in service for each year, then summed to develop the customer component for this plant account.
- The percentage of minimum size cost (Customer Cost), of the Total Plant Value was calculated as the portion represented by the cost of the minimum sized units, 35 foot poles, as previously defined. The percentage of the demand costs for the account is the remainder, after the customer cost component was removed.
- This study was repeated for each Operating Company.

FERC Account 365 - OVERHEAD CONDUCTORS AND DEVICES

This plant distribution account is predominately made up of the various overhead distribution line conductors, operating at either primary or secondary voltage. This study considered primary conductors only, the Company's GIS data is not sufficient to perform a similar analysis on the costs of secondary, service, and/or street-light conductors. The Company's GIS data is not sufficient to perform a Handy-Whitman analysis of the install date for primary conductors.

Assumptions and Method

- The Company's GIS was used to determine the wire miles of overhead distribution primary distribution line conductors. The conductors were categorized into two sizes, large and small.
 - Conductors with a blank or unknown conductor type/size were omitted.
 - Conductor segments longer than 700 feet were omitted as likely being in error.
- The current installed cost for each category of primary line conductor was obtained and used to cost out the currently installed system, if rebuilt using one of those two sizes.
- The minimum grid cost was developed using only the cost of the smaller conductor.
- The percentage of minimum size cost (Customer Cost), of the Total Plant Value was calculated as the portion represented by the cost of the system, built with the minimum sized conductor.

FERC Account 368 - LINE TRANSFORMERS

This plant distribution account is predominately made up of the various distribution transformers used to step the distribution voltage down to the service-voltage level delivered to the customer. This account includes both overhead and pad-mounted transformers.

Assumptions and Method

- The Company's GIS system was used to determine the number of overhead and pad-mounted distribution transformers, by size and install year, to be replaced by the minimum size (25 KVA) overhead line transformer that is in common use within the study territory.
- The current installed cost for each size line transformer was obtained from CREWS, and trended by size to build a list of costs by size for each size overhead and pad-mounted distribution transformer.
- The install years were used to age the current costs for the actual size and minimum size transformers using Handy-Whitman indices, and extended by the number of transformers in service for each year, then summed to develop the customer component for this plant account.
- Transformers missing install year, construction type, or kVA were omitted.
- The percentage of minimum size cost, of the calculated current cost was calculated as the portion represented by the cost of the minimum sized units.

FERC Account 367 – UNDERGROUND CONDUCTORS & DEVICES

Pennsylvania Rate Case

FERC Account 364 – POLES, TOWERS, AND FIXTURES

This plant distribution account is predominately made up of the various wood distribution poles used to support primary and secondary distribution conductors.

Assumptions and Method

Using data from the Company's GIS, the wood pole plant was separated by poles which have both primary and secondary attached facilities, poles with secondary attached facilities, poles with secondary attached facilities and wood poles with street-lighting facilities. To divide up the value of the account, the raw pole counts were calculated as well as a weighting based upon the cost to install a pole in today dollars, 2024.

The Company's pole data allows for the identification of the total wood poles plant, and wood poles with primary facilities attached, but does not allow for the identification of poles with private-outdoor lighting facilities, street-light facilities or secondary facilities. The poles serving primary service customers are allocated to primary rate customers, all other poles will need to be split between all rate classes, except primary service customers.

A list of primary accounts was extracted from the CCS and used as the starting point for traces in the GIS system. From these traces in GIS, for each of the primary accounts and their associated Connection Object were reviewed to determine if multiple primary customers shared primary circuit routes to ensure facilities allocated to primary rate customers were only counted once.

- Only poles supporting primary and secondary conductor were included (i.e., street-light only poles were omitted).
- Only poles where POLE_MAT in (D, L, M, N, P, R, W, Z) were considered ... the other materials are fiberglass, steel, concrete, aluminum, etc. materials that are unlikely for "distribution" poles.
- Only poles where HEIGHT in (15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, & 95) were considered, the other pole heights typically indicate either street-light only poles, i.e., HEIGHT in (12, 15, 16, 17, 20, 27) or may reflect erroneous data.

Pennsylvania Rate Case

FERC Account 365 – OVERHEAD CONDUCTORS & DEVICES

This plant distribution account is predominately made up of the various overhead distribution line conductors, operating at either primary or secondary voltage. This study considered primary conductors only, the Company's GIS data is not sufficient to perform a similar analysis on the costs of secondary and/or service conductors.

Assumptions and Method

The primary conductors are allocated to both primary and secondary rates. To simplify the summations the conductors were divided into two sizes: large and small. The unique conductor paths, avoiding the duplicate counting of conductors, were calculated for all the primary customers back to the breaker on each circuit. The primary conductors were separated into small and large size conductors.

The conductor length of unique primary conductor feet is obtained by obtaining the span length of each primary line segment and then, by segment, multiplying by the number of conductors (1-phase vs 3-phase), and summing to obtain the total primary conductor feet used to serve primary customers. The same process is used for determining the total conductor feet for all primary conductors in the system.

A weighting is then used to account for the differences in cost to install a foot of large vs. small conductor. The weighted conductor length for primary conductors feeding primary rate customers is then compared to the weighted total conductor length of all conductors to obtain the percentage of primary conductor used by the primary rate customers.

Pennsylvania Rate Case

FERC Account 366 – UNDERGROUND CONDUIT

Conduit systems are used to supply both the primary rate and secondary rate customers. The majority of the conduit system is used to protect primary cable (which can be used to serve both primary customers, and secondary customers via transformation), and of that majority, the bulk of the primary conduit system is installed to protect large primary cables. Said another way, where majority of the large-sized primary cables are installed in conduit, and the majority of the small-sized primary cables are direct buried. The majority of secondary cables are direct buried.

Assumptions and Method

The circuit length of unique large sized, underground primary conductor feet is obtained by obtaining the span length of each primary line segment, and summing to obtain the total primary circuit feet used to serve primary customers. The same process is used for determining the total circuit feet for all large primary conductors in the system.

- Conductors with a blank or unknown conductor type/size were omitted
- Conductor segments greater than 2,500' were considered data errors and omitted

The circuit length for large primary conductors, serving primary rate customers, is then compared to the total large primary circuit length to obtain the percentage of conduit systems used by the primary rate customers.

**DIRECT TESTIMONY
OF
MARK A. JONES**

I. INTRODUCTION AND PURPOSE

Q. Please state your name and business address.

A. My name is Mark A. Jones. My business address is 76 South Main Street, Akron, Ohio 44308.

Q. By whom are you employed and in what capacity?

A. I am employed by FirstEnergy Service Company as Vice President, Customer Engagement.

Q. What is your professional and educational background?

A. I have been with FirstEnergy Corp. (“FirstEnergy”) or its predecessor utilities or subsidiaries for 25 years. The majority of my time has been in customer and leadership positions. I have a Bachelor of Arts in Technology from Kent State University. My background and experience are more fully described in Appendix A.

Q. Have you ever testified before any regulatory bodies?

A. Yes, I have testified before the New Jersey Board of Public Utilities.

Q. On whose behalf are you testifying in this proceeding?

A. I am testifying on behalf of FirstEnergy Pennsylvania Electric Company (“FE PA” or “Company”). FE PA consists of the Met-Ed, Penelec, Penn Power, West Penn, and PSU rate districts (individually a “Rate District” and in any combination the “Rate Districts”).¹

¹ FE PA also has a sixth Rate District, the Waverly Rate District, which is not discussed directly in my testimony as it relates to FE PA’s New York jurisdictional rates. The PSU Rate District is encompassed within the West Penn Rate District. To the extent that the testimony does not specifically mention the PSU Rate District, it can be assumed that it is included within the West Penn Rate District.

1 **Q. What is the purpose of your direct testimony?**

2 A. My testimony addresses the customer-focused organizational changes, as well as initiatives
3 that FE PA has implemented over the last 24 to 48 months. Some of these initiatives are
4 part of an ongoing effort to enhance customers' experience. I also testify about FE PA's
5 proposal for a new low-income assistance initiative, its proposal to recover credit card fees,
6 its proposed adjustments to uncollectible expense, and its proposed pilot program for
7 electric vehicles.

8 **Q. Have you prepared any exhibits to accompany your testimony?**

9 A. Yes, I am sponsoring FE PA Exhibit MAJ-1, which provides the components for the
10 uncollectible expense calculations.

11 **II. CUSTOMER EXPERIENCE INITIATIVES**

12 **Q. Please discuss the organizational changes that have taken place recently as well as the**
13 **recent reorganization of FirstEnergy's Customer Experience business.**

14 A. FirstEnergy has undertaken a comprehensive structural and functional redesign of its
15 organizations that provide direct support to its customers and enhanced its overall
16 customer-focused strategy. This redesign allows for a more direct focus on the customers'
17 needs from the customers' perspective gained from real-time insights and surveys.

18 More specifically, the customer-oriented business units have been reorganized to
19 reflect a more customer-centric model, resulting in the Customer Service group being
20 rebranded around Customer Experience, Customer Engagement, and Customer Care. This
21 organization is led by a Senior Vice President of Customer Experience who reports directly
22 to the Chief Operating Officer. Customer Experience consists of Customer Care and
23 Customer Engagement, both which directly support the customer experience of

1 FirstEnergy's operating companies, including FE PA. Each of these groups have distinct
2 areas of focus, but also collectively strive to provide each FirstEnergy customer with the
3 best possible experience and service in the most affordable way.

4 **Q. Can you explain the role of the Customer Care organization?**

5 A. The Customer Care organization is a major operations unit under the Senior Vice President
6 of Customer Experience. Within the Customer Care organization, there are functions that
7 focus on Customer Management (Billing, Controls, Supplier Services), Contact Centers
8 (Customer Care Centers), Revenue Operations (Credit and Collections), National
9 Accounts, Customer Support and Customer Analytics. Customer Care's core function is
10 ensuring the environment, tools, technologies, and policies can protect and meet the needs
11 of FirstEnergy's customers. The team executes strategies to enhance the customer
12 experience, while meeting regulatory commitments and operational excellence. Just
13 recently, in 2023, Customer Care replaced the customer-facing core systems to provide a
14 more seamless, robust omni-channel environment that will continue to evolve over time.
15 In addition to improving this new customer experience platform, Customer Care will
16 continue to focus on creating operational efficiencies through automation, collections
17 scheduling, digital collections, and by unlocking best practices to support customers and
18 employees.

19 **Q. Can you explain what the Customer Engagement Team does?**

20 A. Customer Engagement leads efforts with Economic Development & Business
21 Development, Energy Efficiency, and Customer Policy & Solutions. The Economic
22 Development & Business Development organization staff works to attract traded sector
23 companies into FE PA's service territory, and helps existing trade sector customers expand

1 their operations in the FirstEnergy service territories. This team works closely with state
2 organizations, their partners, as well as regional, local economic development
3 organizations, consultants, local governments, brokers, and developers to assist in enabling
4 a thriving economic growth plan on behalf of the Commonwealth.

5 The Energy Efficiency team develops and helps to implement a broad range of
6 energy efficiency and peak demand reduction programs for residential, low-income,
7 commercial, governmental, and industrial customers. These efforts are designed to meet
8 or exceed each state's long-term energy and sustainability goals. The team educates
9 customers on their energy usage and recommends ways they can improve their overall
10 energy efficiency and conservation efforts. In conjunction with states' various regulatory
11 programs, the team offers incentives and rebates for customers to upgrade their homes or
12 facilities with more efficient and cost-effective technologies and promotes behaviors that
13 reduce energy consumption. Combined, these efforts help customers save money on their
14 electric bills and minimize carbon footprints.

15 Lastly, the Customer Policy & Solutions team develops and delivers products and
16 solutions that customers want from regulated utilities, which comply with legislative and
17 regulatory requirements. For example, the team has been educating customers about
18 electric vehicles and developing additional educational information that customers can
19 access in varying engagement channels.

20 **Q. Do the units within the Customer Experience organization engage in cross-functional**
21 **initiatives?**

22 A. Yes. In addition to each unit's core functions, there is significant cross-department
23 engagement. A customer-focused strategy is the responsibility of all our employees and

1 their work is expected to align with the goal of enhancing the customer experience. For
2 example, low-income programs and digital innovation are two such areas. Through cross-
3 department initiatives, the group has identified an impactful approach to connecting with
4 low-income eligible program customers. The group identified new means to reach
5 customers in need or at risk through video campaigns, employee ambassadors, and targeted
6 communications. The group utilized third party vendors beginning in 2022 to reach
7 communities via digital channels, such as email. As a result, in 2023, FirstEnergy saw a
8 29% increase in the number of customers who qualified for low-income programs in
9 Pennsylvania as compared to the same period in 2022. The campaigns were designed to
10 relay the ease of enrollment and make the experience to connect customers with agencies
11 intuitive and targeted.

12 Similarly, with respect to digital innovation, the Customer Experience team led a
13 cross-department effort that empowered customers and enhanced experiences through
14 items such as mobile-friendly information and visuals, a redesign to outage reporting, and
15 additional education to consumers so that they could harness self-service features and have
16 more information at their fingertips. Over the past several months, agile teams were able
17 to roll out dozens of new digital features for customers across the key customer journeys
18 of Outage, Move In/Move Out, and Payment/Billing.

19 The digital enhancements produced by the Customer Experience organization have
20 focused on capabilities such as navigation, process improvements, proactive
21 communication, and other key features on the FirstEnergy website. During 2023, the team
22 improved quick link functionality, streamlined processes such as “Move In,” included
23 typeahead searches and address first lookups. In 2024 and beyond, mobile enhancements

1 will focus on implementing credit checks, allowing for multiple meter move-ins, additional
2 billing timeline awareness so customers are more connected with their specific billing
3 statuses, autosave functionality, and other capabilities that will help multi-meter customers.
4 FirstEnergy is also looking to enhance the total website design through a key project
5 beginning in 2024 that will last approximately two years and align synergies, the flow, and
6 brand across all pages for a more cohesive, fluid, and tailored experience for customers.
7 With all these examples, the goal is to create digital channels for the customer to seamlessly
8 interact with the Company as effortlessly and effectively as possible.

9 **Q. Please explain how the restructured Customer Experience organization will benefit**
10 **FE PA customers.**

11 A. The restructuring of the Customer Experience organization has helped the Company focus
12 on service satisfaction, brand trust, and product experience. The Customer Experience
13 organization has made strides to modernize the customer facing technologies to provide a
14 more seamless experience. Additionally, a surveying and customer feedback platform was
15 implemented to connect with FE PA's customers and take their feedback through survey
16 results to enhance the customers' experience. FirstEnergy has leveraged additional
17 channels, such as digital platforms, to communicate and educate customers on programs
18 and offerings to make it easier to resolve issues as well as find ways to save on energy
19 usage. To further drive the ability to educate customers on benefits and offerings, such as
20 low-income outreach and electrification programs, FirstEnergy is focusing on new
21 initiatives in Pennsylvania that will increase customer awareness and adoption.

1 **Q. Please explain how FE PA is using customer feedback to improve the Customer**
2 **Experience provided by its Care Centers.**

3 A. In response to feedback from customers, the Customer Experience is focused on several
4 key areas to improve our overall customer centric experience. We are modernizing our
5 technology such as the interactive voice response system to help improve hold times,
6 transfers, and live agent response. We are also optimizing systems to aid in bill payment,
7 move in and move out and outage reporting.

8 **III. CREDIT CARD FEES**

9 **Q. How are credit card fees being handled today?**

10 A. One-time credit card payments are currently assessed a fee by the vendor, which fees are
11 directly passed to the customer making a payment by credit card.

12 **Q. Are there plans to change the collection of fees for credit card payments in the future?**

13 A. Yes. Customers expect to be able to have multiple choices for making payments. This
14 includes increased preference for paying via devices connected to the internet, allowing
15 customers to utilize debit and credit cards to pay their bills through mobile or online
16 applications.

17 Providing options to customers with reasonable costs is a priority for FE PA.
18 Benchmarking and customer surveys indicate that 45% of customers would pay by credit
19 card with no fee. If these fees were included in regulatory recovery, the customer is no
20 longer using the cost of the transaction to determine their path for payment and will choose
21 based on their convenience preference – providing a higher quality customer experience.

1 **Q. What are the additional benefits for a fee-free electronic payment?**

2 A. Additional benefits include:

- 3 • Helping customers avoid disconnect or late payments;
- 4 • Eliminating burden of service fee on customers;
- 5 • Reducing confusion between third-pay vendor service fees verses utility payment
- 6 amount tendered; and
- 7 • Increasing customer satisfaction by providing multiple no-fee options for payment –
- 8 including credit, debit, ACH, and app-supported payment such as PayPal, Venmo,
- 9 ApplePay, and GooglePay; and
- 10 • Reducing inconvenience of sending a check via mail.

11 Recovering service fees across all customers is consistent with other billing and
12 payment utility services provided today, including processing mailed checks and
13 printing/mailing monthly bills where other customers utilize the mobile e-Bill option. All
14 credit, debit, and ACH transactions for residential customers for both one-time and
15 recurring payment will be “fee-free”. Instead, these costs will be assessed by the vendor
16 to FE PA, and then will be included for recovery through base distribution rates as part of
17 the Company’s cost of service. Steps such as this are geared towards making the payment
18 process as easy as possible for customers to make payments - so as to try to remove barriers
19 to payment and help reduce or control uncollectible levels to the benefit of all of the
20 Company’s customers.

1 **Q. What is the annual expense for these credit card service fees and how will the expense**
2 **be recovered?**

3 A. The estimated annual expense for the credit card fees is \$5.2 million for 2025. These costs
4 will be allocated across the residential class only, as these are the customers who will be
5 benefiting from this change. The costs were forecasted at the rate district level based on
6 historical credit card activities by rate district. Monitoring and benchmarking of any
7 proposed fee changes will be completed as they are communicated by the vendor.

8 **IV. LOW-INCOME ASSISTANCE INITIATIVE**

9 **Q. Please discuss the new initiative that FE PA is proposing to further assist low-income**
10 **customers.**

11 A. The Company proposes to create the Energy Assistance Outreach Team, (“EAOT”), whose
12 purpose is to increase awareness of, and participation in, energy assistance programs
13 available to low-income customers throughout FE PA’s service territory. The dedicated
14 team would be responsible for creating educational resources, tools, and technology to
15 reduce or eliminate barriers to program participation. The EAOT would engage with local
16 charity-based organizations to gather information on challenges that reduce program
17 participation. The EAOT would use this information to develop strategies to address the
18 challenges and increase participation. Further, the EAOT will create a presence in the
19 community by hosting or participating in local energy assistance fairs. The EAOT would
20 also provide support to social service agencies when they have questions or special
21 situations. The EAOT would complement similar efforts that are underway in our New
22 Jersey and West Virginia territories.

1 **Q. What specific activities will the EAOT assist customers with?**

2 A. On a broad level, the team will educate low-income residential customers on the assistance
3 programs and assist with the application process for assistance programs. More
4 specifically, the team will:

- 5 1. Be responsible for education, resources, navigation of tools/technology needed to
6 reduce and/or eliminate customer barriers to program participation;
7 2. Work with customers, agencies, local charities, churches, and local governments to
8 understand the types of available programs;
9 3. Help customers by sharing what information is required to participate in the
10 different programs;
11 4. Participate in energy assistance fairs and organize additional events as necessary;
12 and
13 5. Be a support system for agencies to assist with special situations or barriers.

14 **Q. Why is FE PA proposing the EAOT?**

15 A. Twenty-four percent of FE PA's residential customers are estimated to be low-income and
16 only one quarter of those low-income customers participate in available low-income
17 programs. The goal is to connect customers in need with resources that are available to
18 them. A centralized, dedicated team to assist customers with information about enrollment
19 in all assistance programs will benefit customers by helping eligible customers receive
20 assistance to pay their electric bills.

21 **Q. What is the annual budget for the EAOT?**

22 A. FE PA's annual budget for this initiative is \$762,520.

Q. What are the components of the annual budget and how are they budgeted at the Rate District level?

A. Staffing, program materials and travel expenses are the main budget components. These items are broken down in the chart below.

Staff – 7 dedicated and 1 Shared Resource	\$667,520.00
Materials	\$70,000.00
Travel	\$25,000.00
Total (Annually)	\$762,520.00

These costs will only be charged to the Residential class and this overall budget will be allocated based upon each Rate Districts' proportion of total residential customers at the FE PA level.

Q. Will FE PA have dedicated team members for its service territory?

A. Yes, there will be seven full-time staff dedicated to the FE PA service territory.

Q. Please describe the Company's plan for outreach to customers lacking English proficiency.

A. The EAOT will utilize all methods currently implemented across the Company's service territory to provide assistance to customers lacking English proficiency. The Company provides application and outreach materials in Spanish. Customers calling Customer Care Centers can ask for a translator to assist with their call through a telephonic interpreting service that can accommodate over 86 different languages.

Q. How does FE PA intend to measure impact?

A. FE PA intends to measure the impact of the EAOT by monitoring the number of customers enrolled in the Company's assistance programs and comparing it to historical numbers.

V. UNCOLLECTIBLE EXPENSE

Q. Are any changes required in this proceeding to update the uncollectible accounts expense?

A. Yes. Most notably, Chapter 14 of the Public Utility Code, which governs utilities' collections procedures for residential customers, is scheduled to sunset in December of 2024. As a result, a number of changes to the collections procedures outlined in Chapter 14 have been proposed by the legislature. Because the test year ending December 31, 2025, will be used to project the Company's uncollectible accounts expense, these proposed changes, if accepted, could have a significant impact on these calculations as more fully described below.

Q. Please explain the calculations of the components which have been updated within the uncollectible accounts expense.

A. The uncollectible accounts expense for each Rate District is as follows, Met-Ed \$19.2 million, Penelec \$19.7 million, Penn Power \$5 million, and West Penn \$17.1 million for a total of \$61 million, which includes forecasted impacts resulting from increased revenue projections and the potential Chapter 14 collections rule changes.

The first component, revenue impact, is calculated using current rates and the linear increases associated with them resulting in an additional risk of approximately \$3.3 million of increased uncollectible account expense. The second component - arrears risk associated with the potential Chapter 14 collections rule changes, if implemented - is also

factored into the overall uncollectible expense. FE PA Exhibit MAJ-1 demonstrates the effects that the potential Chapter 14 revisions would have on uncollectible expenses, which total approximately \$15.9 million. Specifically, this exhibit highlights the notable risks to uncollectible account expenses associated with these potential rule changes to include: 1) allowing additional PUC approved installment plans and increasing the length of installment agreements for customers who seek PUC installment agreements; 2) extending the disconnection notice window; 3) expanded medical certificate options, including lengthening medical certificates from 30 days to 60 days and allowing more certifications than are currently allowed in a rolling 12 months; 4) summer moratoriums for low-income customers; and 5) elimination of security deposits. See FE PA Exhibit MAJ-1. To the extent that the General Assembly does not adopt the proposed changes to Chapter 14 of the Public Utility Code which form the basis for these adjustments, the Company will accordingly update its uncollectible expense claim for the FPFTY.

VI. ELECTRIC VEHICLE PILOT

Q. Can you summarize the Company's Proposed Electric Vehicle ("EV") Pilot?

A. Yes, the EV Pilot is intended to educate customers about EVs and encourage them to adopt EVs by providing incentives and expanding access to EV charging in the FE PA territory. In this proceeding, the Company is proposing to implement and recover the costs of the EV Pilot.

Q. Why is the Company proposing the EV Pilot?

A. FE PA recognizes that electrification of vehicles will play a significant role in the future of transportation and is proposing the EV pilot to help educate its customers and improve accessibility to that transition. Beyond benefits to the environment, electric vehicles can

1 be a significant method for customers to manage their overall energy wallet for the future.
2 Auto manufacturers are already switching production from internal combustion engine
3 vehicles to EVs. The proposed EV pilot will help customers better understand EV
4 technology and how to take advantage of available grants, rebates, and incentives. The
5 charging installation incentives in the EV Pilot will broaden access to EV charging, making
6 EV ownership more feasible for customers. By focusing on education and accessibility,
7 the goal of the EV pilot is to empower customers by equipping them with the resources
8 and support necessary to transition to electric transportation.

9 **Q. What are the main components of FE PA's EV pilot?**

10 A. The EV Pilot contains two programs: (1) an education and awareness program; and (2) an
11 incentive / rebate program.

12 **Q. Could you explain the main components of the education and awareness program?**

13 A. There are several components to the education and awareness program. First, there is an
14 online EV education platform that will allow customers to learn more about EVs, compare
15 various EV models, and see available incentives and rebates that are offered by FE PA and
16 governmental agencies. This service was provided collectively to FE PA's predecessor
17 companies in 2023 for an annual cost of \$66,671. The Company is seeking to recover
18 future costs of this service as well as expand it to include resources specific to commercial
19 and municipal fleet electrification.

20 Second, there is a grant assistance component that will provide financial support to
21 local governmental entities, school boards, transit authorities, and qualifying non-profit
22 organizations for professional grant application services to secure government funding.

Services include grant writing, application submission, post award reporting, and compliance monitoring.

Third, there is a fleet advisory program to aid commercial and municipal fleets with their fleet electrification transition. Services include feasibility studies, business cases, risk mitigation, cost-benefit analyses, road mapping, and procurement planning.

Fourth, there is a dealership toolkit program. This program will fund kiosks located at dealerships within the service territory that will provide remote concierge services to help educate customers prior to, during, and after their EV purchases. This will provide customers with an additional resource for answering questions about their potential or recent EV purchases including general purchasing information, vehicle maintenance, charging information, home charging installation, utility and governmental rebates and incentives, and utility rate programs. The total costs of the online EV education platform, grant assistance, fleet advisory service, and dealership toolkit program are estimated to be \$3,480,000 annually.

Q. Could you explain the main components of the incentive/rebate program?

A. There are three incentive/rebate components – a residential component, a non-residential component, and a DC fast charger component.

The residential component will offer a rebate for the installation of level 2 electric vehicle supply equipment by a licensed electrician. The rebates will be \$500 per residence. These rebates will help ensure that licensed professionals safely install the charging equipment.

The non-residential component will be available to government agencies, non-profit entities, workplaces, multi-unit dwellings, and commercial publicly available

1 locations. This program includes two sets of rebates – a customer-side make-ready rebate
2 and a utility-side make-ready rebate. The customer-side make-ready rebate will reimburse
3 qualifying customers for costs associated with the electric vehicle supply equipment as
4 well as any electrical work that needs to be done on the customer side of the meter. The
5 rebate amounts are capped at the lesser of \$2,000 per charging port or 75% of the qualifying
6 cost. The cap for customers in environmental justice areas, as defined by the PA
7 Department of Environmental Protection, is the lesser of \$3,000 per charging port or 75%
8 of the qualifying costs. The utility-side make-ready rebates will reimburse qualifying
9 customers for utility construction costs associated with EV charging installations, which
10 are currently billed to those customers as contributions in aid of construction. The rebate
11 amounts are capped at \$6,000 per charging port with an aggregate cap of \$12,000 per site.

12 The DC fast charger rebate component will be available to government agencies
13 and non-profit entities installing DC fast chargers with a minimum charging capability of
14 50 kilowatt per port. Customers utilizing this rebate are prohibited from also utilizing the
15 aforementioned rebates for the same installations. Qualifying costs for the rebate include
16 the electric vehicle supply equipment, customer-side make ready expenses, and utility
17 construction costs billed to the customer as contributions in aid of construction. The rebate
18 amounts are capped at \$25,000 per port with an aggregate cap of \$50,000 per site.

19 The total program allowance will be \$2,000,000 annually for the residential rebate
20 component and \$2,000,000 annually for the combined non-residential and DC fast charging
21 rebate components.

Q. How will the Company recover the costs associated with the EV Pilot?

A. Expenses will be tracked by revenue classes and will be charged directly to the revenue classes benefiting from the programs and recovered through base rates. Allocation across rate districts will be based upon each rate district's proportion of total customers by class at the FE PA level.

Q. Why should FE PA customers fund the EV Pilot?

A. Many of the program elements in the EV Pilot are specifically designed to benefit the public by helping to expand public charging infrastructure or assist public serving entities such as local governments and regional transit authorities. This provides benefit to all customers directly through improved public infrastructure and newer, cleaner public transportation as well as indirectly through reduced tailpipe emissions. Additionally, program elements such as the online education platform and dealership toolkits can even directly benefit customers who opt not to purchase EVs by helping them better understand the technology and providing resources to help them understand whether EVs are the right choice for them.

VII. SETTLEMENT COMMITMENTS

Q. In the Joint Petition for Settlement of Rate Investigation ("Settlement Agreement") that the Pennsylvania Public Utility Commission ("Commission") approved in the 2016 base rate proceeding at Docket Nos. R-2016-2537349, *et al.* FE PA's predecessor companies made various commitments for customer service and the universal services programs. Have the Rate Districts remained in compliance with those provisions?

A. Yes, the Rate Districts are in compliance.

1 **Q. Specifically, the Settlement Agreement required the Company to achieve and**
2 **maintain an annual call answer rate of at least 80% of calls answered within thirty**
3 **seconds beginning with the twelve-month period ended 12/31/2016. Did the Rate**
4 **Districts comply with this provision in the settlement agreement?**

5 A. Yes, the Rate Districts have remained in compliance with this performance metric.

6 **Q. The Rate Districts also agreed to establish a Universal Service Advisory Committee**
7 **(“USAC”) that will hold meetings at least twice a year. Are the Rate Districts in**
8 **compliance with this provision in the Settlement Agreement?**

9 A. Yes. Beginning in 2017, the Rate Districts established a USAC comprising representatives
10 from the Rate Districts, the Pennsylvania Office of Consumer Advocate, the Coalition for
11 Affordable Utility Services and Energy Efficiency in Pennsylvania, the Commission’s
12 Bureau of Investigation and Enforcement, the Commission’s Bureau of Consumer Service
13 and the organizations that administer the Companies’ Universal Service and Energy
14 Conservation Plan (“USECP”), which hold meetings at least twice a year² with respect to
15 the Companies’ USECP programs. The USAC’s purpose is to explore opportunities for
16 enhancements to the Companies’ USECP programs, as well as opportunities for outreach
17 and education, language access, notification to low-income customers regarding topics of
18 interest, including security deposit waivers and bill clarity.

² In 2020, due to the Covid pandemic, the last meeting was held in May 2020. The meetings resumed in 2022.

1 **Q. Was this settlement term continued following the Pennsylvania Consolidation**
2 **proceeding (“PA Consolidation”)?³**

3 A. Yes, as part of the PA Consolidation settlement agreement, the Company agreed to increase
4 frequency and hold USAC meetings on a quarterly basis. Additionally, the Company
5 agreed to expand the USAC meetings to include local organizations and agencies. The
6 Company also committed to maintain specific levels of customer service performance as
7 part of the PA Consolidation settlement agreement.

8 **Q. The Settlement Agreement also required the Company to file to increase the**
9 **maximum credits allowable under its existing customer assistance program by an**
10 **amount proportionate to 50% of the average increase to residential rates. Did the**
11 **Rate Districts comply with this provision in the Settlement Agreement?**

12 A. Yes. An amended USECP for years 2015-2018 increasing the maximum bill-subsidy
13 levels was filed on March 28, 2017, at Docket No. M-2014-2407729, *et al.* A further
14 amended plan was filed on June 20, 2017, at Docket No. M-2014-2407729, *et al* and
15 approved by the Commission on June 22, 2017.

16 **VII. CONCLUSION**

17 **Q. Does this conclude your testimony?**

18 A. Yes.

³ *Joint Application of Metropolitan Edison Company, Pennsylvania Electric Company, Pennsylvania Power Company, West Penn Power Company, Keystone Appalachian Transmission Company, Mid-Atlantic Interstate Transmission, LLC, and FirstEnergy Pennsylvania Electric Company*, Docket Nos. A-2023-3038771, *et al.* (Order entered December 7, 2023).

Resume: Education and Experience of Mark A. Jones

Education:

1994 - Bachelor of Arts in Technology from Kent State University

Experience:

1999 – 2000	Sr. Customer Account Representative, Illuminating Company Service Company
2000 – 2003	National Accounts Representative, FirstEnergy Solutions
2003 - 2006	Consultant, Supply Chain, FirstEnergy Service Company
2006 – 2011	Area Manager, Illuminating Company Service Company
2011-2012	Director, National Accounts, Customer Support & Consumer Products, FirstEnergy Service Company
2012 - 2017	Vice President, External Affairs, Jersey Central Power & Light Utility Service Company
2017-2018	Vice President, Utility Operations, Jersey Central Power & Light Utility Service Company
2018 - 2019	Regional President, Toledo Edison Service Company

**DIRECT TESTIMONY
OF
DYLAN W. D'ASCENDIS**

I. INTRODUCTION AND BACKGROUND

Q. Please state your name and business address.

A. My name is Dylan W. D'Ascendis. My business address is 3000 Atrium Way, Suite 200, Mount Laurel, NJ 08054.

Q. By whom are you employed and in what capacity?

A. I am a Partner at ScottMadden, Inc.

Q. Please summarize your professional experience and educational background.

A. I have offered expert testimony on behalf of investor-owned utilities before over 35 state regulatory commissions in the United States, the Federal Energy Regulatory Commission, the Alberta Utility Commission, the Canadian Energy Regulator, an American Arbitration Association panel, and the Superior Court of Rhode Island on issues including, but not limited to, common equity cost rate, rate of return, valuation, capital structure, class cost of service, and rate design.

On behalf of the American Gas Association ("AGA"), I calculate the AGA Gas Index, which serves as the benchmark against which the performance of the American Gas Index Fund ("AGIF") is measured on a monthly basis. The AGA Gas Index and AGIF are a market capitalization weighted index and mutual fund, respectively, comprised of the common stocks of the publicly traded corporate members of the AGA.

I am a member of the Society of Utility and Regulatory Financial Analysts ("SURFA"). In 2011, I was awarded the professional designation "Certified Rate of Return

Analyst" by SURFA, which is based on education, experience, and the successful completion of a comprehensive written examination.

I am also a member of the National Association of Certified Valuation Analysts ("NACVA") and was awarded the professional designation "Certified Valuation Analyst" by NACVA in 2015.

I am a graduate of the University of Pennsylvania, where I received a Bachelor of Arts degree in Economic History. I have also received a Master of Business Administration with high honors and concentrations in Finance and International Business from Rutgers University.

The details of my educational background and expert witness appearances are shown in Appendix A.

Q. Please describe the purpose of your testimony.

A. The purpose of my testimony is to present evidence on behalf of FirstEnergy Pennsylvania Electric Company ("FE PA" or the "Company") and recommend an allowed rate of return on common equity ("ROE") for its Pennsylvania jurisdictional rate base.

Q. Have you prepared exhibits in support of your recommendation?

A. Yes. I have prepared FE PA Exhibits DWD-1 through DWD-9, which were prepared by me or under my direction.

Q. What is your recommended ROE for FE PA?

A. I recommend that the Pennsylvania Public Utility Commission (the "Commission") authorize FE PA the opportunity to earn an ROE of 11.30% on its jurisdictional rate base. The ratemaking capital structure and cost of long-term debt is sponsored by Company

Witness Wang. The overall rate of return is summarized on page 1 of FE PA Exhibit DWD-1 and in Table 1 below:

Table 1: Summary of Recommended Weighted Average Cost of Capital

<u>Type of Capital</u>	<u>Ratios</u>	<u>Cost Rate</u>	<u>Weighted Cost Rate</u>
Long-Term Debt	46.94%	4.56%	2.14%
Common Equity	<u>53.81%</u>	11.30%	<u>6.08%</u>
Total	<u>100.00%</u>		<u>8.19%</u>

II. SUMMARY

Q. Please summarize your recommended common equity cost rate.

A. My recommended common equity cost rate of 11.30% is summarized on page 2 of FE PA Exhibit DWD-1. I have assessed the market-based common equity cost rates of companies of relatively similar, but not necessarily identical, risk to FE PA. Using companies of relatively comparable risk as proxies is consistent with the principles of fair rate of return established in the *Hope*¹ and *Bluefield*² decisions. No proxy group can be identical in risk to any single company. Consequently, there must be an evaluation of relative risk between the company and the proxy group to determine if it is appropriate to adjust the proxy group's indicated rate of return.

My recommendation results from applying several cost of common equity models, specifically the Discounted Cash Flow ("DCF") model, the Risk Premium Model ("RPM"), and the Capital Asset Pricing Model ("CAPM"), to the market data of a proxy group of 13 electric utilities ("Utility Proxy Group") whose selection criteria will be discussed below. In addition, I applied the DCF model, RPM, and CAPM to a proxy group of 45 domestic, non-price regulated companies comparable in total risk to the Utility Proxy

¹ *Federal Power Comm'n v. Hope Natural Gas Co.*, 320 U.S. 591 (1944) ("Hope").

² *Bluefield Water Works Improvement Co. v. Public Serv. Comm'n*, 262 U.S. 679 (1922) ("Bluefield").

Group (“Non-Price Regulated Proxy Group”).³ The results derived from each are as follows:

Table 2: Summary of Common Equity Cost Rates

Discounted Cash Flow Model	9.89%
Risk Premium Model	11.47%
Capital Asset Pricing Model	12.48%
Cost of Equity Models Applied to Comparable Risk, Non-Price Regulated Companies	<u>12.95%</u>
Indicated Range of Common Equity Cost Rates Before Adjustments	9.89% - 12.95%
Credit Risk Adjustment	-0.08%
Flotation Cost Adjustment	<u>0.21%</u>
Indicated Cost of Common Equity Cost Rates After Adjustment	<u>10.01% - 13.07%</u>
Recommended Cost of Common Equity	<u>11.30%</u>

The indicated common equity cost rates across these models range from 9.89% to 12.95% before any Company-specific adjustments. My Company-specific indicated range of common equity cost rates, adjusted for credit risk and flotation costs, which will be discussed in detail below, is between 10.01% and 13.07%. From this range, I recommend that the Commission authorize an ROE of 11.30% for the Company.

Q. How is the remainder of your direct testimony organized?

A. The remainder of my direct testimony is organized as follows:

- *Section III* – Provides a summary of financial theory and regulatory principles pertinent to the development of the cost of capital;

³ The development of the Non-Price Regulated Proxy Group is explained in more detail in Section V, part D.

- 1 • *Section IV* – Explains my selection of the Utility Proxy Group used to develop my
- 2 analytical results;
- 3 • *Section V* – Discusses the reasonableness of the Company’s requested capital
- 4 structure;
- 5 • *Section VI* – Describes the analyses on which my recommendation is based;
- 6 • *Section VII* – Summarizes my common equity cost rate before adjustments to reflect
- 7 Company-specific factors;
- 8 • *Section VIII* – Explains my adjustments to my common equity cost rate to reflect the
- 9 Company-specific factors; and
- 10 • *Section IX*– Presents my conclusions regarding ROE.

11 **III. GENERAL PRINCIPLES**

12 **Q. What general principles have you considered in arriving at your recommended**

13 **common equity cost rate?**

14 A. In unregulated industries, marketplace competition is the principal determinant of the price

15 of products or services. For regulated public utilities, regulation must act as a substitute

16 for marketplace competition. Assuring that the utility can fulfill its obligations to the

17 public, while providing safe and reliable service, requires a level of earnings sufficient to

18 maintain the integrity of presently invested capital. Sufficient earnings also permit the

19 attraction of needed new capital at a reasonable cost, for which the utility must compete

20 with other firms of comparable risk, consistent with the fair rate of return standards

21 established by the U.S. Supreme Court in the previously cited *Hope* and *Bluefield* cases.

22 The U.S. Supreme Court affirmed the fair rate of return standards in *Hope*, when it

23 stated:

1 The rate-making process under the Act, *i.e.*, the fixing of ‘just and reasonable’
2 rates, involves a balancing of the investor and the consumer interests. Thus
3 we stated in the Natural Gas Pipeline Co. case that ‘regulation does not insure
4 that the business shall produce net revenues.’ 315 U.S. at page 590, 62 S.Ct.
5 at page 745. But such considerations aside, the investor interest has a
6 legitimate concern with the financial integrity of the company whose rates are
7 being regulated. From the investor or company point of view it is important
8 that there be enough revenue not only for operating expenses but also for the
9 capital costs of the business. These include service on the debt and dividends
10 on the stock. Cf. Chicago & Grand Trunk R. Co. v. Wellman, 143 U.S. 339,
11 345, 346 12 S.Ct. 400,402. By that standard the return to the equity owner
12 should be commensurate with returns on investments in other enterprises
13 having corresponding risks. That return, moreover, should be sufficient to
14 assure confidence in the financial integrity of the enterprise, so as to maintain
15 its credit and to attract capital.⁴

16 In summary, the U.S. Supreme Court has found that a return should be adequate to
17 attract capital at reasonable terms and enable the utility to provide service while
18 maintaining its financial integrity. As discussed above, and in keeping with established
19 regulatory standards, that return should be commensurate with the returns expected
20 elsewhere for investments of equivalent risk. The Commission’s decision in this
21 proceeding, therefore, should provide the Company with the opportunity to earn a return
22 that is: (1) adequate to attract capital at reasonable cost and terms; (2) sufficient to ensure
23 its financial integrity; and (3) commensurate with returns on investments in enterprises
24 having corresponding risks.

25 Lastly, the required return for a regulated public utility is established on a stand-
26 alone basis, *i.e.*, for the utility operating company at issue in a rate case. Parent entities,
27 like other investors, have capital constraints and must look at the attractiveness of the
28 expected risk-adjusted return of each investment alternative in their capital budgeting
29 process. That is, utility holding companies that own many utility operating companies have

⁴ *Hope*, 320 U.S. 591, 603 (1944).

1 choices as to where they will invest their capital within the holding company family.
2 Therefore, the opportunity cost concept applies regardless of whether the funding source
3 is public or corporate.

4 When funding is provided by a parent entity, the return still must be sufficient to
5 provide an incentive to allocate equity capital to the subsidiary or business unit rather than
6 other internal or external investment opportunities. That is, the regulated subsidiary must
7 compete for capital with all the parent company's affiliates, and with other similar risk
8 companies, which may include non-utilities. In that regard, investors value corporate
9 entities on a sum-of-the-parts basis and expect each division within the parent company to
10 provide an appropriate risk-adjusted return.

11 It therefore is important that the authorized ROE for the Company reflects the risks
12 and prospects of its operations and supports its financial integrity from a stand-alone
13 perspective. Consequently, the ROE authorized in this proceeding should be sufficient to
14 support the operational (i.e., business risk) and financing (i.e., financial risk) of the
15 Company's utility operations on a stand-alone basis.

16 Marketplace data must be relied on in assessing a common equity cost rate
17 appropriate for ratemaking purposes. Just as the use of the market data for the proxy group
18 adds reliability to the informed expert's judgment used in arriving at a recommended
19 common equity cost rate, the use of multiple, generally accepted common equity cost rate
20 models also adds reliability and accuracy when arriving at a recommended common equity
21 cost rate.

1 **Q. Within that broad framework, how is the cost of capital estimated in regulatory**
2 **proceedings?**

3 A. Regulated utilities primarily use common stock and long-term debt to finance their
4 permanent property, plant, and equipment (i.e., rate base). The fair rate of return for a
5 regulated utility is based on its weighted average cost of capital, in which the costs of the
6 individual sources of capital are weighted by their respective book values.

7 The cost of capital is the return investors require to make an investment in a firm.
8 Investors will provide funds to a firm only if the return that they *expect* is equal to, or
9 greater than, the return that they *require* to accept the risk of providing funds to the firm.

10 The cost of capital (that is, the combination of the costs of debt and equity) is based
11 on the economic principle of “opportunity costs.” The principle of opportunity costs
12 recognizes that investing in any asset (whether debt or equity securities) represents a
13 forgone opportunity to invest in alternative assets. For any investment to be sensible, its
14 expected return must be at least equal to the return expected on alternative investment
15 opportunities with comparable risks. Because investments with like risks should offer
16 similar returns, the opportunity cost of an investment should equal the return available on
17 an investment of comparable risk.

18 The cost of debt is contractually defined and can be directly observed as the interest
19 rate or yield on debt securities. However, the cost of equity is not directly observable and
20 must be estimated based on market data and various financial models. Because the cost of
21 equity is premised on opportunity costs, the models used to determine it are typically
22 applied to a group of “comparable” or “proxy” companies.

1 In the end, the estimated cost of capital should reflect the return that investors
2 require considering the subject company's business and financial risks, and the returns
3 available on comparable investments.

4 **A. Business Risk**

5 **Q. Please define business risk and explain why it is important for determining a fair rate**
6 **of return.**

7 A. The investor-required return on common equity reflects investors' assessment of the total
8 investment risk of the subject firm. Total investment risk is often discussed in the context
9 of business and financial risk.

10 Business risk reflects the uncertainty associated with owning a company's common
11 stock without the company's use of debt and/or preferred stock financing. One way of
12 considering the distinction between business and financial risk is to view the former as the
13 uncertainty of the expected earned return on common equity, assuming the firm is financed
14 with no debt.

15 Examples of business risks generally faced by utilities include, but are not limited
16 to, the regulatory environment, mandatory environmental compliance requirements,
17 customer mix and concentration of customers, service territory economic growth, market
18 demand, operations, capital intensity, size, the degree of operating leverage, emerging
19 technologies including distributed energy resources, the vagaries of weather, and the like,
20 all of which have a direct bearing on earnings.

21 Although analysts, including rating agencies, may categorize business risks
22 individually, as a practical matter, such risks are interrelated and not wholly distinct from
23 one another. When determining an appropriate return on common equity, the relevant issue

1 is where investors see the subject company in relation to other similarly situated utility
2 companies (i.e., the Utility Proxy Group). To the extent investors view a company as being
3 exposed to higher risk, the required return will increase, and vice versa.

4 For regulated utilities, business risks are both long-term and near-term in nature.
5 Whereas near-term business risks are reflected in year-to-year variability in earnings and
6 cash flow brought about by economic or regulatory factors, long-term business risks reflect
7 the prospect of an impaired ability of investors to obtain both a fair rate of return on, and
8 return of, their capital. Moreover, because utilities accept the obligation to provide safe,
9 adequate and reliable service (in exchange for a reasonable opportunity to earn a fair return
10 on their investment), they generally do not have the option to delay, defer, or reject capital
11 investments. Because those investments are capital-intensive, utilities generally do not
12 have the option to avoid raising external funds. The obligation to serve and the
13 corresponding need to access capital is even more acute during period of capital market
14 distress.

15 Because utilities invest in long-lived assets, long-term business risks are of
16 paramount concern to equity investors. That is, the risk of not recovering the return on
17 their investment extends far into the future. The timing and nature of events that may lead
18 to losses, however, also are uncertain and, consequently, those risks and their implications
19 for the required return on equity tend to be difficult to quantify. Regulatory commissions
20 (like investors who commit their capital) must review a variety of quantitative and
21 qualitative data and apply their reasoned judgment to determine how long-term risks weigh
22 in their assessment of the market-required return on common equity.

B. Financial Risk

Q. Please define financial risk and explain why it is important in determining a fair rate of return.

A. Financial risk is the additional risk created by the introduction of debt and preferred stock into the capital structure. The higher the proportion of debt and preferred stock in the capital structure, the higher the financial risk to common equity owners (i.e., failure to receive dividends due to default or other covenants). Therefore, consistent with the basic financial principle of risk and return, common equity investors require higher returns as compensation for bearing higher financial risk.

Q. Are bond and credit ratings a proxy for a firm's combined business and financial risks to equity owners (i.e., investment risk)?

A. Yes, similar bond ratings/issuer credit ratings reflect, and are representative of, similar combined business and financial risks (i.e., total risk) faced by bond investors.⁵ Although specific business or financial risks may differ between companies, the same bond/credit rating indicates that the combined risks are roughly similar from a debtholder perspective. The caveat is that these debtholder risk measures do not translate directly to risks for common equity.

IV. FE PA AND THE UTILITY PROXY GROUP

Q. Why is it necessary to develop a proxy group when estimating the ROE for FE PA?

A. Because FE PA is not publicly traded and does not have publicly traded equity securities, it is necessary to develop groups of publicly traded, comparable companies to serve as

³ Risk distinctions within S&P's bond rating categories are recognized by a plus or minus, e.g., within the A category, an S&P rating can be at A+, A, or A-. Similarly, risk distinction for Moody's ratings are distinguished by numerical rating gradations, e.g., within the A category, a Moody's rating can be A1, A2 and A3.

1 “proxies” for the Company. In addition to the analytical necessity of doing so, the use of
2 proxy companies is consistent with the *Hope* and *Bluefield* comparable risk standards, as
3 discussed above. I have selected two proxy groups that, in my view, are fundamentally
4 risk-comparable to the Company: a Utility Proxy Group and a Non-Price Regulated Proxy
5 Group, which is comparable in total risk to the Utility Proxy Group.

6 Even when proxy groups are carefully selected, it is common for analytical results
7 to vary from company to company. Despite the care taken to ensure comparability, because
8 no two companies are identical, market expectations regarding future risks and prospects
9 will vary within the proxy group. It therefore is common for analytical results to reflect a
10 seemingly wide range, even for a group of similarly situated companies. At issue is how
11 to estimate the ROE from within that range. That determination will be best informed by
12 employing a variety of sound analyses and necessarily must consider the sort of
13 quantitative and qualitative information discussed throughout my direct testimony.
14 Additionally, a relative risk analysis between the Company and the Utility Proxy Group
15 must be made to determine whether or not explicit Company-specific adjustments need to
16 be made to the Utility Proxy Group indicated results.

17 My analyses are based on the Utility Proxy Group, containing U.S. electric utilities.
18 As discussed earlier, utilities must compete for capital with other companies with
19 commensurate risk (including non-utilities) and, to do so, must be provided the opportunity
20 to earn a fair and reasonable return. Consequently, it is appropriate to consider the Utility
21 Proxy Group’s market data in determining the Company’s ROE.

Q. Are you familiar with FE PA's operations?

A. Yes. FE PA owns and operates an electric distribution system across Pennsylvania.⁶ The operations subject to this proceeding are the electric distribution operations in Pennsylvania, which serve approximately 2 million customers over 32,400 square miles. FE PA is not publicly-traded but rather is an operating subsidiary of FirstEnergy Corp. (the "Parent" or "FirstEnergy"), which operates in six states,⁷ serves approximately six million customers, and is publicly traded under symbol FE.

Q. Please explain how you chose the companies in the utility proxy group.

A. Because the cost of equity is a comparative exercise, my objective in developing a proxy group was to select companies that are comparable to the Company. Because the Company is a 100% rate-regulated electric distribution utility, I applied the following criteria to select my Utility Proxy Group:

- (i) They were included in the Eastern, Central, or Western Electric Utility Group of *Value Line Investment Survey* (Standard Edition) ("Value Line");
- (ii) They have 70% or greater of fiscal year 2022 total operating income derived from, and 70% or greater of fiscal year 2022 total assets attributable to, regulated electric operations;
- (iii) At the time of preparation of this testimony, they had not publicly announced that they were involved in any major merger or acquisition activity (i.e., one publicly-traded utility merging with or acquiring another) or any other major development;
- (iv) They have not cut or omitted their common dividends during the five years ending 2022 or through the time of preparation of this testimony;

⁶ FE PA was formed as a consolidated entity consisting of the operations of Metropolitan Edison Company, Pennsylvania Electric Company, Pennsylvania Power Company, and West Penn Power Company.

⁷ FirstEnergy Corp., 2022 SEC Form 10-K, at 1. In addition to Pennsylvania, FirstEnergy also serves customers in Maryland, Ohio, West Virginia, New Jersey, and New York.

- (v) They have *Value Line* and Bloomberg Professional Services (“Bloomberg”) adjusted Beta coefficients (“beta”);
- (vi) They have positive *Value Line* five-year dividends per share (“DPS”) growth rate projections; and
- (vii) They have *Value Line*, Zacks, or Yahoo! Finance consensus five-year earnings per share (“EPS”) growth rate projections.

The following 14 companies met these criteria:

Table 3: Utility Proxy Group Companies

Company Name	Ticker Symbol
Alliant Energy Corporation	LNT
Ameren Corporation	AEE
American Electric Power Corporation	AEP
Duke Energy Corporation	DUK
Edison International	EIX
Entergy Corporation	ETR
Evergy, Inc.	EVRG
IDACORP, Inc.	IDA
NorthWestern Corporation	NWE
OGE Energy Corporation	OGE
Pinnacle West Capital Corporation	PNW
Portland General Electric Company	POR
Southern Company	SO
Xcel Energy Inc.	XEL

V. CAPITAL STRUCTURE

Q. What is FE PA’s requested capital structure?

A. The Company’s requested capital structure consists of 46.19% long-term debt and 53.81% common equity, as shown on page 1 of FE PA Exhibit DWD-1. FE PA’s requested capital structure is its expected capital structure at December 31, 2025, as testified by Company Witness Wang.

Q. How does FE PA's common equity ratio of 53.81% compare with the common equity ratios maintained by the utility proxy group?

A. FE PA's common equity ratio of 53.81% is reasonable and consistent with the range of common equity ratios maintained by the Utility Proxy Group. As shown on pages 1 and 2 of FE PA Exhibit DWD-2, common equity ratios of the Utility Proxy Group companies range from 30.19% to 56.13% for fiscal year 2022.

In addition to comparing FE PA's actual common equity ratio with common equity ratios currently and expected to be maintained by the Utility Proxy Group, I also compared the Company's actual common equity ratio with the equity ratios maintained by the operating subsidiaries of the Utility Proxy Group companies. As shown on page 3 of FE PA Exhibit DWD-2, common equity ratios of the operating utility subsidiaries of the Utility Proxy Group range from 38.87% to 59.36% for fiscal year 2022.

In my opinion, FE PA's expected capital structure consisting of 46.94% long-term debt and 53.81% common equity is appropriate for ratemaking purposes. It is appropriate because it is generally consistent with the capital structure ratios (based on total permanent capital) maintained by the Utility Proxy Group on whose market data I base my recommended common equity cost rate.

VI. COMMON EQUITY COST RATE MODELS

Q. Is it important that cost of common equity models be market-based?

A. Yes. As discussed previously, regulated public utilities, like the Company, must compete for equity in capital markets along with all other companies with commensurate risk, including non-utilities. The cost of common equity is thus determined based on equity market expectations for the returns of those companies. If an individual investor is

choosing to invest their capital among companies with comparable risk, they will choose the company providing a higher return over a company providing a lower return.

Q. Are the cost of common equity models you use market-based models?

A. Yes. The DCF model is market-based in that market prices are used in developing the dividend yield component of the model. Regarding the RPM, the total market risk premium approach uses bond ratings and expected bond yields that reflect the market's assessment of bond/credit risk, and the Predictive Risk Premium Model ("PRPM") uses monthly market returns in addition to expectations of the risk-free rate. In addition, betas (β), which reflect the market/systematic risk component of equity risk premium, are derived from regression analyses of market prices. The CAPM is market based for many of the same reasons that the RPM is market based (i.e., the use of expected bond yields and betas). Selection criteria for the Non-Price Regulated Proxy Group are based on regression analyses of market prices and reflect the market's assessment of total risk.

Q. What analytical approaches did you use to determine the company's ROE?

A. As discussed earlier, I have relied on the DCF model, the RPM, and the CAPM, which I apply to the Utility Proxy Group described above. I also applied these same models to a Non-Price Regulated Proxy Group described later in this section.

I rely on multiple models because reasonable investors use a variety of tools and do not rely exclusively on a single source of information or single model. Moreover, the specific models on which I rely focus on different aspects of return requirements and provide different insights into investors' views of risk and return. The DCF model, for example, estimates the investor-required return assuming a constant expected dividend yield and growth rate in perpetuity, while Risk Premium-based methods (i.e., the RPM and

CAPM approaches) provide the ability to reflect investors' views of risk, future market returns, and the relationship between interest rates and the ROE. Just as the use of market data for the Utility Proxy Group adds the reliability necessary to inform expert judgment in arriving at a recommended common equity cost rate, the use of multiple generally accepted common equity cost rate models also adds reliability and accuracy when arriving at a recommended common equity cost rate.

A. Discounted Cash Flow Model

Q. Please describe the DCF model, generally.

A. The theory underlying the DCF model is that the present value of an expected future stream of net cash flows during the investment holding period can be determined by discounting those cash flows at the cost of capital, or the investors' capitalization rate. DCF theory indicates that an investor buys a stock for an expected total return rate, which is derived from the cash flows received from dividends and market price appreciation. Mathematically, the dividend yield on market price plus a growth rate equals the capitalization rate; i.e., the total common equity return rate expected by investors, as shown in Equation [1] below:

$$K_e = (D_0 (1+g))/P + g$$

where:

K_e = the required Return on Equity;
 D_0 = the annualized Dividend Per Share;
 P = the current stock price; and
 g = the growth rate.

Q. Which version of the DCF model do you use?

A. I used the single-stage constant growth DCF model.

1 **Q. Please describe the dividend yield you used in applying the constant growth DCF**
2 **model.**

3 A. The unadjusted dividend yields are based on the proxy companies' dividends as of
4 December 29, 2023, divided by the average closing market price for the 60 trading days
5 ended December 29, 2023.⁸

6 **Q. Please explain your adjustment to the dividend yield.**

7 A. Because dividends are paid periodically (e.g., quarterly), as opposed to continuously
8 (daily), an adjustment must be made to the dividend yield. This is often referred to as the
9 discrete, or the Gordon Periodic, version of the DCF model.

10 DCF theory calls for using the full growth rate, or D_1 , in calculating the model's
11 dividend yield component. Since the companies in the Utility Proxy Group increase their
12 quarterly dividends at various times during the year, a reasonable assumption is to reflect
13 one-half the annual dividend growth rate in the dividend yield component, or $D_{1/2}$. Because
14 the dividend should be representative of the next 12-month period, this adjustment is a
15 conservative approach that does not overstate the dividend yield. Therefore, the actual
16 average dividend yields in Column 1, page 1 of FE PA Exhibit DWD-3 have been adjusted
17 upward to reflect one-half the average projected growth rate shown in Column 5.

18 **Q. Please explain the basis for the growth rates you apply to the utility proxy group in**
19 **your constant growth DCF model.**

20 A. Investors with more limited resources than institutional investors are likely to rely on
21 widely available financial information services, such as *Value Line*, Zacks, and Yahoo!

⁸ See, Column 1, page 1 of FE PA Exhibit DWD-3.

1 Finance. Investors realize that analysts have significant insight into the dynamics of the
2 industries and individual companies they analyze, as well as companies' abilities to
3 effectively manage the effects of changing laws and regulations, and ever-changing
4 economic and market conditions. For these reasons, I used analysts' five-year forecasts of
5 EPS growth in my DCF analysis.

6 Over the long run, there can be no growth in DPS without growth in EPS. Security
7 analysts' earnings expectations have a more significant influence on market prices than
8 dividend expectations. Thus, using earnings growth rates in a DCF analysis provides a
9 better match between investors' market price appreciation expectations and the growth rate
10 component of the DCF.

11 **Q. Please summarize the constant growth DCF model results.**

12 A. As shown on page 1 of Exhibit DWD-3, the application of the Constant Growth DCF model
13 to the Utility Proxy Group result in mean and median indicated ROEs of 9.89%.

14 **B. The Risk Premium Model**

15 **Q. Please describe the theoretical basis of the RPM.**

16 A. The RPM is based on the fundamental financial principle of risk and return; namely, that
17 investors require greater returns for bearing greater risk. The RPM recognizes that
18 common equity capital has greater investment risk than debt capital, as common equity
19 shareholders are behind debt holders in any claim on a company's assets and earnings. As
20 a result, investors require higher returns from common stocks than from bonds to
21 compensate them for bearing the additional risk.

22 While it is possible to directly observe bond returns and yields, investors' required
23 common equity returns cannot be directly determined or observed. According to RPM

theory, one can estimate a common equity risk premium over bonds (either historically or prospectively) and use that premium to derive a cost rate of common equity. The cost of common equity equals the expected cost rate for long-term debt capital, plus a risk premium over that cost rate, to compensate common shareholders for the added risk of being unsecured and last-in-line for any claim on the corporation's assets and earnings upon liquidation.

Q. Please explain the total market approach RPM.

A. The total market approach RPM adds a prospective public utility bond yield to an average of: (1) an equity risk premium that is derived from a beta-adjusted total market equity risk premium, (2) an equity risk premium based on the S&P Utilities Index, and (3) an equity risk premium based on authorized ROEs for electric utilities.

Q. Please explain how you determined the expected bond yield applicable to the utility proxy group.

A. The first step in the total market approach RPM analysis is to determine the expected bond yield. Because both ratemaking and the cost of capital, including the common equity cost rate, are prospective in nature, a prospective yield on similarly-rated long-term debt is essential. Because I am unaware of any publication that provides forecasted public utility bond yields, I relied on a consensus forecast of about 50 economists of the expected yield on Aaa-rated corporate bonds for the six calendar quarters ending with the second calendar quarter of 2025, and *Blue Chip's* long-term projections for 2025 to 2029, and 2030 to 2034. As shown on line 1, page 1 of Exhibit DWD-4, the average expected yield on Moody's Aaa-rated corporate bonds is 4.90%.

1 Because that 4.90% estimate represents a corporate bond yield and not a utility
2 specific bond yield, I adjusted the expected Aaa-rated corporate bond yield to an equivalent
3 A2-rated public utility bond yield. That resulted in an upward adjustment of 0.73%, which
4 represents a recent spread between Aaa-rated corporate bonds and A2-rated public utility
5 bonds.⁹ Adding that recent 0.73% spread to the expected Aaa-rated corporate bond yield
6 of 4.90% results in an expected A2-rated public utility bond yield of 5.63%.

7 I then reviewed the average credit rating for the Utility Proxy Group from Moody's
8 to determine if an adjustment to the estimated A2-rated public utility bond was necessary.
9 Since the Utility Proxy Group's average Moody's long-term issuer rating is Baa1, another
10 adjustment to the expected A2-rated public utility bond is needed to reflect the difference
11 in bond ratings. An upward adjustment of 0.17%, which represents two-thirds of a recent
12 spread between A2-rated and Baa2-rated public utility bond yields, is necessary to make
13 the A2-rated prospective bond yield applicable to an Baa1-rated public utility bond.¹⁰
14 Adding the 0.17% to the 5.63% prospective A2-rated public utility bond yield results in a
15 5.80% expected bond yield applicable to the Utility Proxy Group.

⁹ As shown on line 2 and explained in note 2, page 1 of FE PA Exhibit DWD-4.

¹⁰ As shown on line 4 and explained in note 3, page 1 of FE PA Exhibit DWD-4.

**Table 4: Summary of the Calculation of the Utility Proxy Group
Projected Bond Yield¹¹**

Prospective Yield on Moody's Aaa-Rated Corporate Bonds (<i>Blue Chip</i>)	4.90%
Adjustment to Reflect Yield Spread Between Moody's Aaa-Rated Corporate Bonds and Moody's A2-Rated Utility Bonds	0.73%
Adjustment to Reflect the Utility Proxy Group's Average Moody's Bond Rating of Baa1	<u>0.17%</u>
Prospective Bond Yield Applicable to the Utility Proxy Group	<u>5.80%</u>

To develop the total market approach RPM estimate of the appropriate return on equity, this prospective bond yield is then added to the average of the three different equity risk premiums, which I now discuss, in turn.

a. Beta-Derived Equity Risk Premium

Q. Please explain how the beta-derived equity risk premium is determined.

A. The components of the beta-derived risk premium model are: (1) an expected market equity risk premium over corporate bonds, and (2) the beta. The derivation of the beta-derived equity risk premium that I applied to the Utility Proxy Group is shown on lines 1 through 9, page 6 of Exhibit DWD-4. The total beta-derived equity risk premium I applied is based on an average of three historical market data-based equity risk premiums, two *Value Line*-based equity risk premiums and a Bloomberg-based equity risk premium. Each of these is described below.

¹¹ As shown on page 1 of FE PA Exhibit DWD-4.

1 **Q. How did you derive a market equity risk premium based on long-term historical**
 2 **data?**

3 A. To derive a historical market equity risk premium, I used the most recent holding period
 4 returns for the large company common stocks from the Stocks, Bonds, Bills, and Inflation
 5 (“SBBI”) Yearbook 2023 (“SBBI - 2023”)¹² less the average historical yield on Moody’s
 6 Aaa/Aa2-rated corporate bonds for the period 1928 to 2022. Using holding period returns
 7 over a very long time is appropriate because it is consistent with the long-term investment
 8 horizon presumed by investing in a going concern, i.e., a company expected to operate in
 9 perpetuity.

10 SBBI’s long-term arithmetic mean monthly total return rate on large company
 11 common stocks was 11.78% and the long-term arithmetic mean monthly yield on Moody’s
 12 Aaa/Aa2-rated corporate bonds was 5.96%.¹³ As shown on line 1, page 6 of Exhibit DWD-
 13 4, subtracting the mean monthly bond yield from the total return on large company stocks
 14 results in a long-term historical equity risk premium of 5.82%.

15 I used the arithmetic mean monthly total return rates for the large company stocks
 16 and yields (income returns) for the Moody’s Aaa/Aa2-rated corporate bonds, because they
 17 are appropriate for the purpose of estimating the cost of capital as noted in SBBI - 2023.¹⁴

18 Using the arithmetic mean return rates and yields is appropriate because historical total
 19 returns and equity risk premiums provide insight into the variance and standard deviation
 20 of returns needed by investors in estimating future risk when making a current investment.

21 If investors relied on the geometric mean of historical equity risk premiums, they would

¹² See, SBBI-2023 Appendix A Tables: Kroll Stocks, Bonds, Bills, & Inflation 1926-2022.

¹³ As explained in note 1, page 7 of FE PA Exhibit DWD-4.

¹⁴ SBBI - 2023, at page 200-201.

1 have no insight into the potential variance of future returns, because the geometric mean
 2 relates the change over many periods to a constant rate of change, thereby obviating the
 3 year-to-year fluctuations, or variance, which is critical to risk analysis.

4 **Q. Please explain the derivation of the regression-based market equity risk premium.**

5 A. To derive the regression-based market equity risk premium of 7.27% shown on line 2, page
 6 6 of Exhibit DWD-4, I used the same monthly annualized total returns on large company
 7 common stocks relative to the monthly annualized yields on Moody's Aaa/Aa2-rated
 8 corporate bonds as mentioned above. I modeled the relationship between interest rates and
 9 the market equity risk premium using the observed monthly market equity risk premium
 10 as the dependent variable, and the monthly yield on Moody's Aaa/Aa2-rated corporate
 11 bonds as the independent variable. I then used a linear Ordinary Least Squares ("OLS")
 12 regression, in which the market equity risk premium is expressed as a function of the
 13 Moody's Aaa/Aa2-rated corporate bonds yield:

$$RP = \alpha + \beta (R_{Aaa/Aa2})$$

15 **Q. Please explain the derivation of the PRPM equity risk premium.**

16 A. The PRPM, published in the *Journal of Regulatory Economics*,¹⁵ was developed from the
 17 work of Robert F. Engle, who shared the Nobel Prize in Economics in 2003 "for methods
 18 of analyzing economic time series with time-varying volatility ("ARCH")".¹⁶ Engle found
 19 that volatility changes over time and is related from one period to the next, especially in
 20 financial markets. Engle discovered that volatility of prices and returns clusters over time

¹⁵ Autoregressive conditional heteroscedasticity. See "A New Approach for Estimating the Equity Risk Premium for Public Utilities", Pauline M. Ahern, Frank J. Hanley and Richard A. Michelfelder, Ph.D. *The Journal of Regulatory Economics* (December 2011), 40:261-278.

¹⁶ www.nobelprize.org.

1 and is therefore highly predictable and can be used to predict future levels of risk and risk
2 premiums.

3 The PRPM estimates the risk-return relationship directly, as the predicted equity
4 risk premium is generated by predicting volatility or risk. The PRPM is not based on an
5 estimate of investor behavior, but rather on an evaluation of the results of that behavior
6 (i.e., the variance of historical equity risk premiums).

7 The inputs to the model are the historical monthly returns on large company
8 common stocks minus the monthly yields on Moody's Aaa/Aa-rated corporate bonds
9 during the period from January 1928 through December 2023.¹⁷ Using a generalized form
10 of ARCH, known as GARCH, I calculated each Utility Proxy Group company's projected
11 equity risk premium using Eviews[®] statistical software. When the GARCH model is
12 applied to the historical return data, it produces a predicted GARCH variance series and a
13 GARCH coefficient. Multiplying the predicted monthly variance by the GARCH
14 coefficient and then annualizing it¹⁸ produces the predicted annual equity risk premium.
15 The resulting PRPM predicted a market equity risk premium of 9.35%.¹⁹

16 **Q. Please explain the derivation of a projected equity risk premium based on *Value Line***
17 **data for your RPM analysis.**

18 A. As noted above, because both ratemaking and the cost of capital are prospective, a
19 prospective market equity risk premium is needed. The derivation of the forecasted or
20 prospective market equity risk premium can be found in note 4, page 7 of Exhibit DWD-

¹⁷ Data from January 1928 to December 2022 is from SBBI - 2023. Data from January 2023 to September 2023 is from Bloomberg.

¹⁸ Annualized Return = (1 + Monthly Return) ^12 - 1.

¹⁹ Shown on line 3, page 6 of FE PA Exhibit DWD-4.

1 4. Consistent with my calculation of the dividend yield component in my DCF analysis,
2 this prospective market equity risk premium is derived from an average of the three- to
3 five-year median market price appreciation potential by *Value Line* for the 13 weeks ended
4 December 29, 2023, plus an average of the median estimated dividend yield for the
5 common stocks of the 1,700 firms covered in *Value Line*'s Standard Edition.²⁰

6 The average median expected price appreciation is 62%, which translates to a
7 12.82% annual appreciation, and, when added to the average of *Value Line*'s median
8 expected dividend yields of 2.33%, equates to a forecasted annual total return rate on the
9 market of 15.15%. The forecasted Moody's Aaa-rated corporate bond yield of 4.90% is
10 deducted from the total market return of 15.15%, resulting in an equity risk premium of
11 10.25%, as shown on line 4, page 6 of Exhibit DWD- 4.

12 **Q. Please explain the derivation of an equity risk premium based on the S&P 500**
13 **companies.**

14 A. Using data from *Value Line*, I calculated an expected total return on the S&P 500 companies
15 using expected dividend yields and long-term growth estimates as a proxy for capital
16 appreciation. The expected total return for the S&P 500 is 14.14%. Subtracting the
17 prospective yield on Moody's Aaa-rated corporate bonds of 4.90% results in a 9.24%
18 projected equity risk premium.

19 **Q. Please explain the derivation of an equity risk premium based on Bloomberg data.**

20 A. Using data from Bloomberg, I calculated an expected total return on the S&P 500 using
21 expected dividend yields and long-term growth estimates as a proxy for capital

²⁰ As explained in detail in note 1, page 2 of FE PA Exhibit DWD-4.

appreciation, identical to the method described above. The expected total return for the S&P 500 is 17.52%. Subtracting the prospective yield on Moody's Aaa-rated corporate bonds of 4.90% results in a 12.62% projected equity risk premium.

Q. What is your conclusion of a beta-derived equity risk premium for use in your RPM analysis?

A. I gave equal weight to all six equity risk premiums based on each source - historical, *Value Line*, and Bloomberg - in arriving at an 9.09% equity risk premium.

Table 5: Summary of the Calculation of the Equity Risk Premium Using Total Market Returns²¹

Historical Spread Between Total Returns of Large Stocks and Aaa and Aa2-Rated Corporate Bond Yields (1928 – 2022)	5.82%
Regression Analysis on Historical Data	7.27%
PRPM Analysis on Historical Data	9.35%
Prospective Equity Risk Premium using Total Market Returns from <i>Value Line</i> Summary & Index less Projected Aaa Corporate Bond Yields	10.25%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from <i>Value Line</i> for the S&P 500 less Projected Aaa Corporate Bond Yields	9.24%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from Bloomberg Professional Services for the S&P 500 less Projected Aaa Corporate Bond Yields	<u>12.62%</u>
Average	<u>9.09%</u>

After calculating the average market equity risk premium of 9.09%, I adjusted it by beta to account for the risk of the Utility Proxy Group. As discussed below, beta is a meaningful measure of prospective relative risk to the market as a whole, and is a logical way to allocate a company's, or proxy group's, share of the market's total equity risk

²¹ As shown on page 6 of FE PA Exhibit DWD-4.

1 premium relative to corporate bond yields. As shown on page 6 of FE PA Exhibit DWD-
2 4, the average of the mean and median beta for the Utility Proxy Group is 0.81. Multiplying
3 the 0.81 average beta by the market equity risk premium of 9.09% results in a beta-adjusted
4 equity risk premium for the Utility Proxy Group of 7.36%.

5 **b. S&P Utility Index Derived Equity Risk Premium**

6 **Q. How did you derive the equity risk premium based on the S&P utility index and**
7 **Moody's A2-rated public utility bonds?**

8 A. I estimated three equity risk premiums based on S&P Utility Index holding period returns,
9 and two equity risk premiums based on the expected returns of the S&P Utilities Index,
10 using *Value Line* and Bloomberg data, respectively. Turning first to the S&P Utility Index
11 holding period returns, I derived a long-term monthly arithmetic mean equity risk premium
12 between the S&P Utility Index total returns of 10.63% and monthly Moody's A2-rated
13 public utility bond yields of 6.44% from 1928 to 2022 to arrive at an equity risk premium
14 of 4.20%.²² I then used the same historical data to derive an equity risk premium of 5.01%
15 based on a regression of the monthly equity risk premiums. The final S&P Utility Index
16 holding period equity risk premium involved applying the PRPM using the historical
17 monthly equity risk premiums from January 1928 to December 2023 to arrive at a PRPM-
18 derived equity risk premium of 4.80% for the S&P Utility Index.

19 I then derived expected total returns on the S&P Utilities Index of 10.63% and
20 10.61% using data from *Value Line* and Bloomberg, respectively, and subtracted the
21 prospective Moody's A2-rated public utility bond yield of 5.63%,²³ which resulted in

²² As shown on line 1, page 10 of Exhibit DWD-4.

²³ Derived on line 3, page 1 of Exhibit DWD-4.

equity risk premiums of 5.00% and 4.98%, respectively. As with the market equity risk premiums, I averaged each risk premium based on each source (i.e., historical, *Value Line*, and Bloomberg) to arrive at my utility-specific equity risk premium of 4.80%.

Table 6: Summary of the Calculation of the Equity Risk Premium Using S&P Utility Index Holding Returns²⁴

Historical Spread Between Total Returns of the S&P Utilities Index and A2-Rated Utility Bond Yields (1928 – 2022)	4.20%
Regression Analysis on Historical Data	5.01%
PRPM Analysis on Historical Data	4.80%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from <i>Value Line</i> for the S&P Utilities Index less Projected A2 Utility Bond Yields	5.00%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from Bloomberg Professional Services for the S&P Utilities Index less Projected A2 Utility Bond Yields	<u>4.98%</u>
Average	<u>4.80%</u>

c. Authorized Return Derived Equity Risk Premium

Q. How do you derive an equity risk premium of 4.85% based on authorized ROEs for electric utilities?

A. The equity risk premium of 4.85% shown on line 3, page 5 of FE PA Exhibit DWD-4 is the result of a regression analysis based on regulatory awarded ROEs related to the yields on Moody's A2-rated public utility bonds. That analysis is shown on page 9 of FE PA Exhibit DWD-4. Page 9 of FE PA Exhibit DWD-4 contains the graphical results of a regression analysis of 1,232 rate cases for electric utilities which were fully litigated during the period from January 1, 1980 through December 29, 2023. It shows the implicit equity risk premium relative to the yields on A2-rated public utility bonds immediately prior to the issuance of each regulatory decision.

²⁴ As shown on page 10 of Exhibit DWD-4.

1 It is readily discernible that there is an inverse relationship between the yield on
2 A2-rated public utility bonds and equity risk premiums. In other words, as interest rates
3 decline, the equity risk premium rises and vice versa, a result consistent with financial
4 literature on the subject.²⁵ I used the regression results to estimate the equity risk premium
5 applicable to the projected yield on Moody's A2-rated public utility bonds. Given the
6 expected A2-rated utility bond yield of 5.63%, it can be calculated that the indicated equity
7 risk premium applicable to that bond yield is 4.85%, which is shown on line 3, page 5 of
8 FE PA Exhibit DWD-4.

9 **Q. What is your conclusion of an equity risk premium for use in your total market**
10 **approach RPM analysis?**

11 A. The equity risk premium I apply to the Utility Proxy Group is 5.67%, which is the average
12 of the beta-adjusted equity risk premium for the Utility Proxy Group, the S&P Utilities
13 Index, and the authorized return utility equity risk premiums of 7.36%, 4.80%, and 4.85%,
14 respectively.²⁶

15 **Q. What is the indicated RPM common equity cost rate based on the total market**
16 **approach?**

17 A. As shown on line 7, page 1 of FE PA Exhibit DWD-4 and shown on Table 7, below, I
18 calculated a common equity cost rate of 11.47% for the Utility Proxy Group based on the
19 total market approach RPM.

²⁵ See, e.g., Robert S. Harris and Felicia C. Marston, *The Market Risk Premium: Expectational Estimates Using Analysts' Forecasts*, *Journal of Applied Finance*, Vol. 11, No. 1, 2001, at pages 11 to 12; Eugene F. Brigham, Dilip K. Shome, and Steve R. Vinson, *The Risk Premium Approach to Measuring a Utility's Cost of Equity*, *Financial Management*, Spring 1985, at pages 33 to 45.

²⁶ As shown on page 5 of FE PA Exhibit DWD-4.

Table 7: Summary of the Total Market Return Risk Premium Model²⁷

Prospective Moody's Baa1-Rated Utility Bond Applicable to the Utility Proxy Group	5.80%
Prospective Equity Risk Premium	<u>5.67%</u>
Indicated Cost of Common Equity	<u>11.47%</u>

C. The Capital Asset Pricing Model**Q. Please explain the theoretical basis of the CAPM.**

A. CAPM theory defines risk as the co-variability of a security's returns with the market's returns as measured by beta (β). A beta less than 1.0 indicates lower variability than the market as a whole, while a beta greater than 1.0 indicates greater variability than the market.

The CAPM assumes that all non-market or unsystematic risk can be eliminated through diversification. The risk that cannot be eliminated through diversification is called market, or systematic, risk. In addition, the CAPM presumes that investors only require compensation for systematic risk, which is the result of macroeconomic and other events that affect the returns on all assets. The model is applied by adding a risk-free rate of return to a market risk premium, which is adjusted proportionately to reflect the systematic risk of the individual security relative to the total market as measured by the beta. The traditional CAPM model is expressed as:

$$R_s = R_f + \beta (R_m - R_f)$$

Where: R_s = Return rate on the common stock

R_f = Risk-free rate of return

R_m = Return rate on the market as a whole

²⁷ As shown on page 1 of FE PA Exhibit DWD-4.

β = Adjusted beta (volatility of the
security relative to the market as a whole)

Numerous tests of the CAPM have measured the extent to which security returns and beta are related as predicted by the CAPM, confirming its validity. The empirical CAPM ("ECAPM") reflects the reality that while the results of these tests support the notion that the beta is related to security returns, the empirical Security Market Line ("SML") described by the CAPM formula is not as steeply sloped as the predicted SML.²⁸ The ECAPM reflects this empirical reality.

Q. Why is the use of the ECAPM appropriate in determining the ROE for FE PA?

The ECAPM is a well-established model that has been relied on in both academic and regulatory settings. Fama and French clearly state regarding Figure 2, below, that "[t]he returns on the low beta portfolios are too high, and the returns on the high beta portfolios are too low."²⁹

²⁸ Morin, at page 220.

²⁹ Eugene F. Fama and Kenneth R. French, "The Capital Asset Pricing Model: Theory and Evidence", *Journal of Economic Perspectives*, Vol. 18, No. 3, Summer 2004 at 33 "Fama & French".

Figure 2 <http://pubs.aeaweb.org/doi/pdfplus/10.1257/0895330042162430>

Average Annualized Monthly Return versus Beta for Value Weight Portfolios Formed on Prior Beta, 1928–2003

In addition, Morin observes that while the results of these tests support the notion that beta is related to security returns, the empirical SML described by the CAPM formula is not as steeply sloped as the predicted SML. Morin states:

With few exceptions, the empirical studies agree that ... low-beta securities earn returns somewhat higher than the CAPM would predict, and high-beta securities earn less than predicted.³⁰

* * *

Therefore, the empirical evidence suggests that the expected return on a security is related to its risk by the following approximation:

$$K = R_F + x \beta(R_M - R_F) + (1-x) \beta(R_M - R_F)$$

where x is a fraction to be determined empirically. The value of x that best explains the observed relationship [is] $\text{Return} = 0.0829 + 0.0520 \beta$ is between 0.25 and 0.30. If $x = 0.25$, the equation becomes:

$$K = R_F + 0.25(R_M - R_F) + 0.75 \beta(R_M - R_F)^{31}$$

³⁰ Morin, at 207.

³¹ Morin, at 221.

Fama and French provide similar support for the ECAPM when they state:

The early tests firmly reject the Sharpe-Lintner version of the CAPM. There is a positive relation between beta and average return, but it is too 'flat'... The regressions consistently find that the intercept is greater than the average risk-free rate... and the coefficient on beta is less than the average excess market return... This is true in the early tests... as well as in more recent cross-section regressions tests, like Fama and French (1992).³²

Finally, Fama and French further note:

Confirming earlier evidence, the relation between beta and average return for the ten portfolios is much flatter than the Sharpe-Linter CAPM predicts. The returns on low beta portfolios are too high, and the returns on the high beta portfolios are too low. For example, the predicted return on the portfolio with the lowest beta is 8.3 percent per year; the actual return as 11.1 percent. The predicted return on the portfolio with the highest beta is 16.8 percent per year; the actual is 13.7 percent.³³

Research from Dianna R. Harrington also supports the use of the ECAPM.

Harrington summarizes studies on the predicted results of the CAPM versus the actual returns in her text Modern Portfolio Theory & the Capital Asset Pricing Model:

So far we have learned some very interesting things about the CAPM and reality. Some of the earliest work tested realized data (history) against data generated by simulated portfolios. Early studies by Douglas (1969) and Lintner (Douglas [1969]) showed discrepancies between what was expected on the basis of the CAPM and the actual relationships that were apparent in the capital markets. Theoretically, the minimal rate of return from the portfolios (the intercept) and the actual risk-free rate for the period should have been equal. They were not.

* * *

Another study, now more famous than Lintner's was done by Black, Jensen, and Scholes (1972). Lintner had used what is called a cross-sectional method (looking at a number of stock returns during one time period), whereas Black, Jensen, and Scholes used a time-series method (using returns for a number of stocks over several time periods). To make their test, Black, Jensen, and Scholes assumed that what had happened in the past was a good proxy for the investor expectations (a

³² Fama & French, at 32.

³³ Fama & French, at 33.

frequent assumption in CAPM tests). Using historical data, they generated estimates using what we call the market model:

$$R_{jt} = \alpha_j + \beta_j (R_{mt}) + \varepsilon_j$$

Where:

R = total returns

β = the slope of the line (the incremental return for risk)

α = the intercept or a constant (expected to be 0 over time and across all firms)

ε = an error term (expected to be random, without information)

m = the market proxy

j = the firm or portfolio

t = the time period

Instead of using single stocks, they formed portfolios in an effort to wash out one source of error; because betas of single firms are quite unstable. On the basis of the CAPM, they expected to find

1. That the intercept was equal to the risk-free rate (their proxy was the Treasury bill rate)
2. That the capital market line had a positive slope and that riskier (higher beta) securities provided higher return

Instead they found

1. That the intercept was different from the risk-free rate
2. That high-risk securities earned less and low-risk securities earned more than predicted by the model
3. That the intercept seemed to depend on the beta of any asset: high-beta stocks had a different intercept than low-beta stocks

* * *

Fama and MacBeth (1974) criticized the Black, Jensen, and Scholes study (hereafter called BJS). In a reformation of the study, they supported the first of the BJS findings. They found that the intercept exceeded the risk-free proxy, but did not find the evidence to support the other BJS conclusions.³⁴

³⁴ Dianna R. Harrington, Modern Portfolio Theory & the Capital Asset Pricing Model – A User's Guide, Prentice-Hall, Inc. 1983, at 43-45.

Harrington discusses Black's potential solution to this phenomenon:

Black's replacement for the risk-free asset was a portfolio that had no covariability with the market portfolio. Because the relevant risk in the CAPM is systematic risk, a risk-free asset would be the one with no volatility relative to the market – that is, a portfolio with a beta of zero. All investor-perceived levels of risk could be obtained from various linear combinations of Black's zero-beta portfolio and the market portfolio... Since R_z (the rate of return of the zero-beta asset) and R_m are uncorrelated (as R_f and R_m were assumed to be in the simple CAPM), the investor can choose from various combinations of R_z and R_m . On segment $R_m Y$, R_z is sold short and proceeds are invested in R_m . On segment $R_z R_m$, portions of the zero-beta portfolio are purchased. At R_m , the investor is fully invested in the market portfolio. The equilibrium CAPM was rewritten by Black as follows:

$$E(R_i) = (1 - \beta_i) E(R_z) + \beta_i E(R_m)$$

Where:

E indicates expected,
 $E(R_z)$ is less than $E(R_m)$, and
 R_z holdings over the whole market must be in equilibrium. That is, the number of short sellers and lenders of securities must be equal.

Black's adaptation is intriguing. The result of using this model is a capital market line that has a less steep slope and a higher intercept than those of the simple CAPM. If Black's model is more correct in its description of investor behavior in the marketplace, then the use of the simple model would produce equity return predictions that would be too low for stocks with betas greater than one and too high for stocks with betas of less than one.³⁵

Clearly, the justification from Morin, Fama and French, and Harrington, along with their reviews of other academic research on the CAPM, validate the use of the ECAPM. In addition, the New York Public Service Commission has been using this form of the CAPM, with factors of 0.25 and 0.75, since the mid-1990s. As such, the ECAPM is a well-established model that has been relied on in both academic and regulatory settings. I continue to believe it is an appropriate model to estimate FE PA's ROE, and in view of

³⁵ Dianna R. Harrington, Modern Portfolio Theory & the Capital Asset Pricing Model – A User's Guide, Prentice-Hall, Inc. 1983, at 43-45.

theory and practical research, I have applied both the traditional CAPM and the ECAPM to the companies in the Utility Proxy Group and averaged the results.

Q. What beta coefficients did you use in your CAPM analysis?

A. For the beta in my CAPM analysis, I considered two sources: *Value Line* and Bloomberg Professional Services. While both of those services adjust their calculated (or “raw”) betas to reflect the tendency of beta to regress to the market mean of 1.00, *Value Line* calculates beta over a five-year period, while Bloomberg calculates it over a two-year period.

Q. Please describe your selection of a risk-free rate of return.

A. As shown in FE PA Exhibit DWD-5, the risk-free rate adopted for both applications of the CAPM is 4.15%. This risk-free rate is based on the average of the *Blue Chip* consensus forecast of the expected yields on 30-year U.S. Treasury bonds for the six quarters ending with the second calendar quarter of 2025, and long-term projections for the years 2025 to 2029 and 2030 to 2034.

Q. Why do you use the projected 30-year treasury yield in your analyses?

A. The yield on long-term U.S. Treasury bonds is almost risk-free and its term is consistent with the long-term cost of capital to public utilities measured by the yields on Moody’s A2-rated public utility bonds; the long-term investment horizon inherent in utilities’ common stocks; and the long-term life of the jurisdictional rate base to which the allowed fair rate of return (i.e., cost of capital) will be applied. In contrast, short-term U.S. Treasury yields are more volatile and largely a function of Federal Reserve monetary policy.

1 **Q. Please explain the estimation of the expected risk premium for the market used in**
 2 **your CAPM analyses.**

3 A. The basis of the market risk premium is explained in detail in note 1 on Exhibit DWD-5.
 4 As discussed above, the market risk premium is derived from an average of three historical
 5 data-based market risk premiums, two *Value Line* data-based market risk premiums, and
 6 one Bloomberg data-based market risk premium.

7 The long-term income return on U.S. Government securities of 5.00% was
 8 deducted from the SBBI - 2023 monthly historical total market return of 12.03%, which
 9 results in an historical market equity risk premium of 7.03%.³⁶ I applied a linear OLS
 10 regression to the monthly annualized historical returns on the S&P 500 relative to historical
 11 yields on long-term U.S. Government securities from SBBI -2023. That regression
 12 analysis yielded a market equity risk premium of 8.27%. The PRPM market equity risk
 13 premium is 10.44%, and is derived using the PRPM relative to the yields on long-term U.S.
 14 Treasury securities from January 1926 through December 2023.

15 The *Value Line*-derived forecasted total market equity risk premium is derived by
 16 deducting the forecasted risk-free rate of 4.15%, discussed above, from the *Value Line*
 17 projected total annual market return of 15.15%, resulting in a forecasted total market equity
 18 risk premium of 11.00%. The S&P 500 projected market equity risk premium using *Value*
 19 *Line* data is derived by subtracting the projected risk-free rate of 4.15% from the projected
 20 total return of the S&P 500 of 14.14%. The resulting market equity risk premium is 9.99%.

21 The S&P 500 projected market equity risk premium using Bloomberg data is
 22 derived by subtracting the projected risk-free rate of 4.15% from the projected total return

³⁶ SBBI - 2023, at Appendix A-1 (1) through A-1 (3) and Appendix A-7 (19) through A-7 (21).

of the S&P 500 of 17.52%. The resulting market equity risk premium is 13.37%. These six measures, when averaged, result in an average total market equity risk premium of 10.02%.

Table 8: Summary of the Calculation of the Market Risk Premium for Use in the CAPM³⁷

Historical Spread Between Total Returns of Large Stocks and Long-Term Government Bond Yields (1926 – 2022)	7.03%
Regression Analysis on Historical Data	8.27%
PRPM Analysis on Historical Data	10.44%
Prospective Equity Risk Premium using Total Market Returns from <i>Value Line</i> Summary & Index less Projected 30-Year Treasury Bond Yields	11.00%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from <i>Value Line</i> for the S&P 500 less Projected 30-Year Treasury Bond Yields	9.99%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from Bloomberg Professional Services for the S&P 500 less Projected 30-Year Treasury Bond Yields	<u>13.37%</u>
Average	<u>10.02%</u>

Q. What are the results of your application of the traditional and empirical CAPM to the utility proxy group?

A. As shown on page 1 of Exhibit DWD-5, the mean result of my CAPM/ECAPM analyses is 12.45%, the median is 12.50%, and the average of the two is 12.48%. Consistent with my reliance on the average of mean and median DCF results discussed above, the indicated common equity cost rate using the CAPM/ECAPM is 12.48%.

³⁷ As shown on page 2 of Exhibit DWD-5.

D. Common Equity Cost Rates for a Proxy Group of Domestic, Non-Price Regulated Companies Based on the DCF, RPM, and CAPM

Q. Why do you also consider a proxy group of domestic, non-price regulated companies?

A. Although I am not an attorney, my interpretation of the *Hope* and *Bluefield* cases is that they did not specify that comparable risk companies had to be utilities. Since the purpose of rate regulation is to be a substitute for marketplace competition, non-price regulated firms operating in the competitive marketplace make an excellent proxy if they are comparable in total risk to the Utility Proxy Group being used to estimate the cost of common equity. The selection of such domestic, non-price regulated competitive firms theoretically and empirically results in a proxy group which is comparable in total risk to the Utility Proxy Group, since all of these companies compete for capital in the exact same markets.

Q. How did you select non-price regulated companies that are comparable in total risk to the utility proxy group?

A. In order to select a proxy group of domestic, non-price regulated companies similar in total risk to the Utility Proxy Group, I relied on the betas and related statistics derived from *Value Line* regression analyses of weekly market prices over the most recent 260 weeks (i.e., five years). These selection criteria resulted in a proxy group of 45 domestic, non-price regulated firms comparable in total risk to the Utility Proxy Group. Total risk is the sum of non-diversifiable market risk and diversifiable company-specific risks. The criteria used in selecting the domestic, non-price regulated firms was:

- (i) They must be covered by *Value Line Investment Survey* (Standard Edition);
- (ii) They must be domestic, non-price regulated companies, i.e., not utilities;

- 1 (iii) Their betas must lie within plus or minus two standard deviations of the average
2 unadjusted betas of the Utility Proxy Group; and
3 (iv) The residual standard errors of the *Value Line* regressions which gave rise to the
4 unadjusted betas must lie within plus or minus two standard deviations of the
5 average residual standard error of the Utility Proxy Group.

6 Betas measure market, or systematic, risk, which is not diversifiable. The residual
7 standard errors of the regressions measure each firm's company-specific, diversifiable risk.
8 Companies that have similar betas and similar residual standard errors resulting from the
9 same regression analyses have similar total investment risk.

10 **Q. Have you prepared an exhibit which shows the data from which you selected the 45**
11 **domestic, non-price regulated companies that are comparable in total risk to the**
12 **utility proxy group?**

13 A. Yes, the basis of my selection and both proxy groups' regression statistics are shown in
14 Exhibit DWD-6.

15 **Q. Did you calculate common equity cost rates using the DCF model, RPM, and CAPM**
16 **for the non-price regulated proxy group?**

17 A. Yes. Because the DCF model, RPM, and CAPM have been applied in an identical manner
18 as described above, I will not repeat the details of the rationale and application of each
19 model. One exception is in the application of the RPM, where I did not use public utility-
20 specific equity risk premiums.

21 Page 2 of Exhibit DWD-7 derives the Constant Growth DCF model common equity
22 cost rate. As shown, the indicated common equity cost rate is 10.80%.

23 Pages 3 through 5 of Exhibit DWD-7 contain the data and calculations that support
24 the 13.76% RPM common equity cost rate. As shown on line 1, page 3 of Exhibit DWD-

1 7, the consensus prospective yield on Moody's Baa-rated corporate bonds for the six
2 quarters ending in the second quarter of 2025, and for the years 2025 to 2029 and 2030 to
3 2034, is 5.95%.³⁸ Since the Non-Price Regulated Proxy Group has an average Moody's
4 long-term issuer rating of A3, a downward adjustment of 0.28% to the projected Baa2-
5 rated corporate bond yield is necessary to reflect a difference in ratings which results in a
6 projected A3-rated corporate bond yield of 5.67% for the Non-Regulated Proxy group.

7 When the beta-adjusted risk premium of 8.09%³⁹ relative to the Non-Price
8 Regulated Proxy Group is added to the prospective A3-rated corporate bond yield of
9 5.67%, the indicated RPM common equity cost rate is 13.76%.

10 Page 6 of Exhibit DWD-7 contains the inputs and calculations that support my
11 indicated CAPM/ECAPM common equity cost rate of 13.28%.

12 **Q. How is the cost rate of common equity based on the non-price regulated proxy group**
13 **comparable in total risk to the utility proxy group?**

14 A. As shown on page 1 of Exhibit DWD-7, the results of the common equity models applied
15 to the Non-Price Regulated Proxy Group -- which group is comparable in total risk to the
16 Utility Proxy Group -- are as follows: 10.80% (DCF), 13.76% (RPM), and 13.28%
17 (CAPM). The average of the mean and median of these models is 12.95%, which I used
18 as the indicated common equity cost rates for the Non-Price Regulated Proxy Group.

³⁸ *Blue Chip Financial Forecasts*, January 1, 2024 at 2 and December 1, 2023 at 14.

³⁹ Derived on page 5 of Exhibit DWD-7.

VII. CONCLUSION OF COMMON EQUITY COST RATE BEFORE ADJUSTMENTS

Q. What is the indicated common equity cost rate before adjustments?

A. By applying multiple cost of common equity models to the Utility Proxy Group and the Non-Price Regulated Proxy Group, the indicated range of common equity cost rates attributable to the Utility Proxy Group before any relative risk adjustments is between 9.89% and 12.95%. I used multiple cost of common equity models as primary tools in arriving at my recommended common equity cost rate, because each of these models is theoretically sound and available to investors, and because no single model is so inherently precise that it can be relied on to the exclusion of other theoretically sound models. Using multiple models adds reliability to the estimated common equity cost rate, with the prudence of using multiple cost of common equity models supported in both the financial literature and regulatory precedent.

Based on these common equity cost rate results, I conclude that a range of common equity cost rates between 9.89% and 12.95% is reasonable and appropriate before any adjustments for relative risk differences between FE PA and the Utility Proxy Group are made.

VIII. ADJUSTMENTS TO THE COMMON EQUITY COST RATE

A. Size Adjustment

Q. Does a company's size relative to the utility proxy group companies increase its business risk?

A. Yes. A smaller size relative to the Utility Proxy Group companies indicates greater relative business risk for the Company because, all else being equal, size has a material bearing on risk. Size affects business risk because smaller companies generally are less able to cope

1 with significant events that affect sales, revenues and earnings. For example, smaller
 2 companies face more risk exposure to business cycles and economic conditions, both
 3 nationally and locally. Additionally, the loss of revenues from a few larger customers
 4 would have a greater effect on a small company than on a bigger company with a larger,
 5 more diverse, customer base. This is true for utilities, as well as for non-regulated
 6 companies.

7 As further evidence that smaller firms are riskier, investors generally demand
 8 greater returns from smaller firms to compensate for less marketability and liquidity of
 9 their securities. Kroll's Cost of Capital Navigator: U.S. Cost of Capital Module ("Kroll")
 10 discusses the nature of the small-size phenomenon, providing an indication of the
 11 magnitude of the size premium based on several measures of size. In discussing "Size as
 12 a Predictor of Equity Premiums," Kroll states:

13 The size effect is based on the empirical observation that companies of
 14 smaller size are associated with greater risk and, therefore, have greater cost
 15 of capital [sic]. The "size" of a company is one of the most important risk
 16 elements to consider when developing cost of equity capital estimates for
 17 use in valuing a business simply because size has been shown to be a
 18 *predictor* of equity returns. In other words, there is a significant (negative)
 19 relationship between size and historical equity returns - as size *decreases*,
 20 returns tend to *increase*, and vice versa. (footnote omitted) (emphasis in
 21 original)⁴⁰

22 Furthermore, in "The Capital Asset Pricing Model: Theory and Evidence," Fama
 23 and French note size is indeed a risk factor which must be reflected when estimating the
 24 cost of common equity. On page 14, they note:

25 . . . the higher average returns on small stocks and high book-to-market
 26 stocks reflect unidentified state variables that produce undiversifiable

⁴⁰ Kroll, Cost of Capital Navigator: U.S. Cost of Capital Module, Size as a Predictor of Equity Returns, at 1.

risks (covariances) in returns not captured in the market return and are priced separately from market betas.⁴¹

Based on this evidence, Fama and French proposed their three-factor model which includes a size variable in recognition of the effect size has on the cost of common equity.

Also, it is a basic financial principle that the use of funds invested, and not the source of funds, is what gives rise to the risk of any investment.⁴² Eugene Brigham, a well-known authority, states:

A number of researchers have observed that portfolios of small-firms (sic) have earned consistently higher average returns than those of large-firm stocks; this is called the “small-firm effect.” On the surface, it would seem to be advantageous to the small firms to provide average returns in a stock market that are higher than those of larger firms. In reality, it is bad news for the small firm; **what the small-firm effect means is that the capital market demands higher returns on stocks of small firms than on otherwise similar stocks of the large firms.** (emphasis added)⁴³

Consistent with the financial principle of risk and return discussed above, increased relative risk due to small size must be considered in the allowed rate of return on common equity.

Q. Is a relative risk adjustment due to FE PA’s small size when compared to the utility proxy group necessary in this proceeding?

A. No. FE PA has similar risk to the average utility in the Utility Proxy Group because FE PA is similar in size to the Utility Proxy Group companies. I measured FE PA’s size based on an estimated market capitalization of common for FE PA (whose common stock is not publicly traded).

⁴¹ Fama & French, at 25-43.

⁴² Brealey, Richard A. and Myers, Stewart C., Principles of Corporate Finance (McGraw-Hill Book Company, 1996), at 204-205, 229.

⁴³ Brigham, Eugene F., Fundamentals of Financial Management, Fifth Edition (The Dryden Press, 1989), at 623.

**Table 9: Size as Measured by Market Capitalization for FE PA's
Electric Operations and the Utility Proxy Group**

	Market Capitalization* (\$ Millions)	Times Greater than The Company
FE PA	\$6,567	
Utility Proxy Group	\$15,918	2.4x
*From page 1 of Exhibit DWD-8.		

FE PA's estimated market capitalization was \$6.6 billion as of December 29, 2023, compared with the market capitalization of the average company in the Utility Proxy Group of \$15.9 billion as of December 29, 2023. The average company in the Utility Proxy Group has a market capitalization 2.4 times the size of FE PA's estimated market capitalization.

As a result, it is necessary to consider if an adjustment to the indicated range of common equity cost rates attributable to the Utility Proxy Group is necessary. The determination is based on the size premiums for portfolios of New York Stock Exchange, American Stock Exchange, and NASDAQ listed companies ranked by deciles for the 1926 to 2022 period.⁴⁴ The average size premium for the Utility Proxy Group with a market capitalization of \$15.9 billion falls in the 2nd decile, while the Company's estimated market capitalization of \$6.6 billion places it in the 3rd decile. The size premium spread between the 2nd decile and the 3rd decile is 0.12%. It is my determination that the size premium spread between the 2nd and 3rd decile of 0.12% is not significant enough to include it in the determination of my recommended range of ROEs at this time.

⁴⁴ Source: Kroll, Cost of Capital Navigator.

B. Credit Risk Adjustment

Q. Please discuss your proposed credit risk adjustment.

A. FE PA's long-term issuer ratings are A3 and BBB from Moody's Investors Services and S&P, respectively, which are slightly less risky than the average long-term issuer ratings for the Utility Proxy Group of Baa1 and BBB+, respectively.⁴⁵ Hence, an downward credit risk adjustment is necessary to reflect the less risky credit rating, i.e., A3, of FE PA relative to the Baa1 average Moody's bond rating of the Utility Proxy Group.⁴⁶

An indication of the magnitude of the necessary downward adjustment to reflect the lesser credit risk inherent in a A3 bond rating is one-third of a recent three-month average spread between Moody's A2 and Baa2-rated public utility bond yields of 0.25%, shown on page2 of Exhibit DWD-4, or 0.08%.⁴⁷

C. Flotation Cost Adjustment

Q. What are flotation costs?

A. Flotation costs are those costs associated with the sale of new issuances of common stock. They include market pressure and the mandatory unavoidable costs of issuance (e.g., underwriting fees and out-of-pocket costs for printing, legal, registration, etc.). For every dollar raised through debt or equity offerings, the Company receives less than one full dollar in financing.

⁴⁵ Source of Information: S&P Global Market Intelligence.

⁴⁶ As shown on page 3 of Exhibit DWD-4.

⁴⁷ $0.08\% = 0.25\% * (1/3)$.

1 **Q. Why is it important to recognize flotation costs in the allowed common equity cost**
2 **rate?**

3 A. It is important because there is no other mechanism in the ratemaking paradigm through
4 which such costs can be recognized and recovered. Because these costs are real, necessary,
5 and legitimate, recovery of these costs should be permitted. As noted by Morin:

6 The costs of issuing these securities are just as real as operating and
7 maintenance expenses or costs incurred to build utility plants, and fair
8 regulatory treatment must permit recovery of these costs....

9 The simple fact of the matter is that common equity capital is not
10 free....[Flotation costs] must be recovered through a rate of return
11 adjustment.⁴⁸

12 **Q. Should flotation costs be recognized only if there was an issuance during the test year**
13 **or there is an imminent post-test year issuance of additional common stock?**

14 A. No. As noted above, there is no mechanism to recapture such costs in the ratemaking
15 paradigm other than an adjustment to the allowed common equity cost rate. Flotation costs
16 are charged to capital accounts and are not expensed on a utility's income statement. As
17 such, flotation costs are analogous to capital investments, albeit negative, reflected on the
18 balance sheet. Recovery of capital investments relates to the expected useful lives of the
19 investment. Since common equity has a very long and indefinite life (assumed to be
20 infinity in the standard regulatory DCF model), flotation costs should be recovered through
21 an adjustment to common equity cost rate, even when there has not been an issuance during
22 the test year, or in the absence of an expected imminent issuance of additional shares of
23 common stock.

⁴⁸ Morin, at 329.

Historical flotation costs are a permanent loss of investment to the utility and should be accounted for. When any company, including a utility, issues common stock, flotation costs are incurred for legal, accounting, printing fees and the like. For each dollar of issuing market price, a small percentage is expensed and is permanently unavailable for investment in utility rate base. Since these expenses are charged to capital accounts and not expensed on the income statement, the only way to restore the full value of that dollar of issuing price with an assumed investor required return of 10% is for the net investment to earn more than 10% to net back to the investor a fair return on that dollar. In other words, if a company issues stock at \$1.00 with 5% in flotation costs, it will net \$0.95 in investment. Assuming the investor in that stock requires a 10% return on their invested \$1.00 (i.e., a return of \$0.10), the company needs to earn approximately 10.5% on its invested \$0.95 to receive a \$0.10 return.

Q. Do the common equity cost rate models you have used already reflect investors' anticipation of flotation costs?

A. No. All of these models assume no transaction costs. The literature is quite clear that these costs are not reflected in the market prices paid for common stocks. For example, Brigham and Daves confirm this and provide the methodology utilized to calculate the flotation adjustment.⁴⁹ In addition, Morin confirms the need for such an adjustment even when no new equity issuance is imminent.⁵⁰ Consequently, it is proper to include a flotation cost

⁴⁹ Eugene F. Brigham and Phillip R. Daves, Intermediate Financial Management, 9th Edition, Thomson/Southwestern, at p. 342.

⁵⁰ Morin, at 342.

adjustment when using cost of common equity models to estimate the common equity cost rate.

Q. How did you calculate the flotation cost allowance?

A. I modified the DCF calculation to provide a dividend yield that would reimburse investors for issuance costs in accordance with the method cited in literature by Brigham and Daves, as well as by Morin. The flotation cost adjustment recognizes the actual costs of issuing equity that were incurred by FirstEnergy. Based on the issuance costs shown on page 1 of Exhibit DWD-9, an adjustment of 0.21% is required to reflect the flotation costs applicable to the Utility Proxy Group.

Q. What is the indicated cost of common equity after your company-specific adjustments?

A. Applying the negative 0.08% credit risk adjustment and the 0.21% flotation cost adjustment to the indicated range of common equity cost rates between 9.89% and 12.95% results in a range of common equity cost rates between 10.01% and 13.07%.

IX. CONCLUSIONS REGARDING RETURN ON COMMON EQUITY

Q. What is your recommended ROE for FE PA?

A. Given the discussion above and the results from the analyses in this testimony, I recommend that an ROE of 11.30%, within a range between 10.01% and 13.07% is appropriate for the Company at this time.

Q. In your opinion, is your proposed ROE of 11.30% just and reasonable to FE PA and its customers?

A. Yes, it is.

1 **Q.** **Does this conclude your testimony?**

2 **A.** Yes, it does.

Summary

Dylan is an experienced consultant and a Certified Rate of Return Analyst (CRRA) and Certified Valuation Analyst (CVA). Dylan joined ScottMadden in 2016 and is a leading expert witness with respect to cost of capital, capital structure, and valuation. He has served as a consultant for investor-owned and municipal utilities and authorities for 15 years. Dylan has testified as an expert witness on over 150 occasions regarding rate of return, cost of service, rate design, and valuation before more than 35 regulatory jurisdictions in the United States and Canada, an American Arbitration Association panel, and the Superior Court of Rhode Island. He also maintains the benchmark index against which the Hennessy Gas Utility Mutual Fund performance is measured. Dylan holds a B.A. in economic history from the University of Pennsylvania and an M.B.A. with concentrations in finance and international business from Rutgers University.

						Average	<u>9.89 %</u>
						Median	<u>9.89 %</u>
						Average of Mean and Median	<u>9.89 %</u>

Notes:

- (1) Indicated dividend at 12/29/2023 divided by the average closing price of the last 60 trading days ending 12/29/2023 for each company.
- (2) From pages 2 through 15 of this Exhibit
- (3) Average of columns 2 through 4 excluding negative growth rates.
- (4) This reflects a growth rate component equal to one-half the conclusion of growth rate (from column 5) x column 1 to reflect the periodic payment of dividends (Gordon Model) as opposed to the continuous payment. Thus, for Alliant Energy Corporation, $3.62\% \times (1 + (1/2 \times 6.48\%)) = 3.74\%$.
- (5) Column 5 + Column 6.
- (6) Results were excluded from the final average and median as they were more than two standard deviations from the proxy group's mean.

Notes provided on page 7 of this Exhibit.

FirstEnergy Pennsylvania Electric Companies
Derivation of Equity Risk Premium Based on the Total Market Approach
Using the Beta for the
Utility Proxy Group

Notes:

- (1) Based on the arithmetic mean historical monthly returns on large company common stocks from Kroll 2022 SBBI® Yearbook minus the arithmetic mean monthly yield of Moody's average Aaa and Aa corporate bonds from 1928-2022.
- (2) This equity risk premium is based on a regression of the monthly equity risk premiums of large company common stocks relative to Moody's average Aaa and Aa rated corporate bond yields from 1928-2022 referenced in note 1 above.
- (3) The Predictive Risk Premium Model (PRPM) is discussed in Mr. D'Ascendi's Direct Testimony. The PRPM risk premium is derived by applying the PRPM to the monthly risk premiums between Kroll large company common stock monthly returns and average Aaa and Aa corporate monthly bond yields, from January 1928 through December 2023.
- (4) The equity risk premium based on the Value Line Summary and Index is derived by subtracting the average consensus forecast of Aaa corporate bonds of 4.90% (from page 1 of this Exhibit) from the projected 3-5 year total annual market return of 15.15% (described fully in note 1 on page 2 of Exhibit DWD-5).
- (5) Using data from Value Line for the S&P 500, an expected total return of 14.14% was derived based upon expected dividend yields and long-term earnings growth estimates as a proxy for capital appreciation. Subtracting the average consensus forecast of Aaa corporate bonds of 4.90% results in an expected equity risk premium of 9.24%.
- (6) Using data from Bloomberg for the S&P 500, an expected total return of 17.52% was derived based upon expected dividend yields and long-term earnings growth estimates as a proxy for capital appreciation. Subtracting the average consensus forecast of Aaa corporate bonds of 4.90% results in an expected equity risk premium of 12.62%.
- (7) Average of mean and median beta from page 1 of Exhibit DWD-5.

FirstEnergy Pennsylvania Electric Companies
Derivation of Mean Equity Risk Premium Based Studies
Using Holding Period Returns and
Projected Market Appreciation of the S&P Utility Index

<u>Line No.</u>	<u>Equity Risk Premium based on S&P Utility Index Holding Period Returns (1):</u>	<u>Implied Equity Risk Premium</u>
1.	Historical Equity Risk Premium	4.20 %
2.	Regression of Historical Equity Risk Premium (2)	5.01
3.	Forecasted Equity Risk Premium Based on PRPM (3)	4.80
4.	Forecasted Equity Risk Premium based on Projected Total Return on the S&P Utilities Index (Value Line Data) (4)	5.00
5.	Forecasted Equity Risk Premium based on Projected Total Return on the S&P Utilities Index (Bloomberg Data) (5)	<u>4.98</u>
6.	Average Equity Risk Premium (6)	<u><u>4.80 %</u></u>

- Notes: (1) Based on S&P Public Utility Index monthly total returns and Moody's Public Utility Bond average monthly yields from 1928-2022. Holding period returns are calculated based upon income received (dividends and interest) plus the relative change in the market value of a security over a one-year holding period.
- (2) This equity risk premium is based on a regression of the monthly equity risk premiums of the S&P Utility Index relative to Moody's A2 rated public utility bond yields from 1928 - 2022 referenced in note 1 above.
- (3) The Predictive Risk Premium Model (PRPM) is applied to the risk premium of the monthly total returns of the S&P Utility Index and the monthly yields on Moody's A2 rated public utility bonds from January 1928 - December 2023.
- (4) Using data from Value Line for the S&P Utilities Index, an expected return of 10.63% was derived based on expected dividend yields and long-term growth estimates as a proxy for market appreciation. Subtracting the expected A2 rated public utility bond yield of 5.63%, calculated on line 3 of page 1 of this Exhibit results in an equity risk premium of 5.00%. (10.63% - 5.63% = 5.00%)
- (5) Using data from Bloomberg Services for the S&P Utilities Index, an expected return of 10.61% was derived based on expected dividend yields and long-term growth estimates as a proxy for market appreciation. Subtracting the expected A2 rated public utility bond yield of 5.63%, calculated on line 3 of page 1 of this Exhibit results in an equity risk premium of 4.98%. (10.61% - 5.63% = 4.98%)
- (6) Average of lines 1 through 5.

Notes on page 2 of this Exhibit.

FirstEnergy Pennsylvania Electric Companies
Notes to Accompany the Application of the CAPM and ECAPM

Notes:

- (1) The market risk premium (MRP) is derived by using six different measures from three sources: Kroll, Value Line, and Bloomberg as illustrated below:

Historical Data MRP Estimates:

Measure 1: Kroll Arithmetic Mean MRP (1926-2022)

Arithmetic Mean Monthly Returns for Large Stocks 1926-2022:	12.03 %
Arithmetic Mean Income Returns on Long-Term Government Bonds:	5.00
MRP based on Kroll Historical Data:	<u>7.03 %</u>

Measure 2: Application of a Regression Analysis to Kroll Historical Data (1926-2022)

8.27 %

Measure 3: Application of the PRPM to Kroll Historical Data: (January 1926 - December 2023)

10.44 %

Value Line MRP Estimates:

Measure 4: Value Line Projected MRP Thirteen weeks ending December 29, 2023.

Total projected return on the market 3-5 years hence*:	15.15 %
Projected Risk-Free Rate (see note 2):	4.15
MRP based on Value Line Summary & Index:	<u>11.00 %</u>
*Forecasted 3-5 year capital appreciation plus expected dividend yield	

Measure 5: Value Line Projected Return on the Market based on the S&P 500

Total return on the Market based on the S&P 500:	14.14 %
Projected Risk-Free Rate (see note 2):	4.15
MRP based on Value Line data	<u>9.99 %</u>

Measure 6: Bloomberg Projected MRP

Total return on the Market based on the S&P 500:	17.52 %
Projected Risk-Free Rate (see note 2):	4.15
MRP based on Bloomberg data	<u>13.37 %</u>

Average of Value Line, Kroll, and Bloomberg MRP: 10.02 %

- (2) For reasons explained in the direct testimony, the appropriate risk-free rate for cost of capital purposes is the average forecast of 30 year Treasury Bonds per the consensus of nearly 50 economists reported in Blue Chip Financial Forecasts. (See pages 8 and 9 of Exhibit DWD-4) The projection of the risk-free rate is illustrated below:

First Quarter 2024	4.30 %
Second Quarter 2024	4.30
Third Quarter 2024	4.20
Fourth Quarter 2024	4.10
First Quarter 2025	4.00
Second Quarter 2025	4.00
2025-2029	4.10
2030-2034	4.20
	<u>4.15 %</u>

- (3) Average of Column 6 and Column 7.

- (4) Results were excluded from the final average and median as they were more than two standard deviations from the proxy group's mean.

FirstEnergy Pennsylvania Electric Companies
Basis of Selection of the Group of Non-Price Regulated Companies
Comparable in Total Risk to the Utility Proxy Group

The criteria for selection of the proxy group of non-price regulated companies comparable in total risk to the Utility Proxy Group was that the non-price regulated companies be domestic and reported in Value Line Investment Survey (Standard Edition).

The proxy group of non-price regulated companies was selected based on the unadjusted beta range of 0.65 - 0.91 and residual standard error of the regression range of 2.6538 - 3.1650 of the proxy group of fourteen electric utilities.

These ranges are based upon plus or minus two standard deviations of the unadjusted beta and standard error of the regression. Plus or minus three standard deviations captures 95.50% of the distribution of unadjusted betas and residual standard errors of the regression.

The standard deviation of the Utility Proxy Group's residual standard error of the regression is 0.1278. The standard deviation of the standard error of the regression is calculated as follows:

$$\text{Standard Deviation of the Std. Err. of the Regr.} = \frac{\text{Standard Error of the Regression}}{\sqrt{2N}}$$

where: N = number of observations. Since Value Line betas are derived from weekly price change observations over a period of five years, N = 259

$$\text{Thus,} \quad 0.1278 \quad = \quad \frac{2.9094}{\sqrt{518}} \quad = \quad \frac{2.9094}{22.7596}$$

Notes:

- (1) Average of columns 2 through 4 excluding negative growth rates.
- (2) The application of the DCF model to the domestic, non-price regulated comparable risk companies is identical to the application of the DCF to the Utility Proxy Groups. The dividend yield is derived by using the 60 day average price and the spot indicated dividend as of December 29, 2023. The dividend yield is then adjusted by 1/2 the average projected growth rate in EPS, which is calculated by averaging the 5 year projected growth in EPS provided by Value Line, www.zacks.com, and www.yahoo.com (excluding any negative growth rates) and then adding that growth rate to the adjusted dividend yield.
- (3) Results were excluded from the final average and median as they were more than two standard deviations from the proxy group's mean.

FirstEnergy Pennsylvania Electric Companies
Indicated Common Equity Cost Rate
Through Use of a Risk Premium Model
Using an Adjusted Total Market Approach

<u>Line No.</u>		<u>Proxy Group of Forty- Five Non-Price Regulated Companies</u>
1.	Prospective Yield on Baa2 Rated Corporate Bonds (1)	5.95 %
2	Adjustment to Reflect Bond rating Difference of Non-Price Regulated Companies (2)	<u>(0.28)</u>
3	Adjusted Prospective Bond Yield	5.67
4.	Equity Risk Premium (3)	<u>8.09</u>
5.	Risk Premium Derived Common Equity Cost Rate	<u><u>13.76</u> %</u>

Notes: (1) Average forecast of Baa corporate bonds based upon the consensus of nearly 50 economists reported in Blue Chip Financial Forecasts dated December 28, 2023 and December 1, 2023 (see pages 8 and 9 of Exhibit DWD-4). The estimates are detailed below.

First Quarter 2024	6.10 %
Second Quarter 2024	6.00
Third Quarter 2024	6.00
Fourth Quarter 2024	5.90
First Quarter 2025	5.80
Second Quarter 2025	5.80
2025-2029	6.00
2030-2034	<u>6.00</u>
Average	<u><u>5.95</u> %</u>

(2) The average yield spread of Baa2 rated corporate bonds over A2 corporate bonds for the three months ending December 2023. To reflect the A3 average rating of the Non-Price Regulated Proxy Group, the prospective yield on Baa corporate bonds must be adjusted by 2/3 of the spread between A2 and Baa2 corporate bond yields as shown below:

	A2 Corp. Bond Yield	Baa2 Corp. Bond Yield	Spread
Dec-23	5.26 %	5.65 %	0.39 %
Nov-23	5.87	6.29	0.42
Oct-23	6.18	6.63	0.45
		Average yield spread	<u>0.42</u>
		2/3 of spread	<u><u>0.28</u></u>

FE PA STATEMENT NO. 11
Weizhong (Bill) Wang

**BEFORE THE
PENNSYLVANIA PUBLIC UTILITY COMMISSION**

FIRSTENERGY PENNSYLVANIA ELECTRIC COMPANY

DOCKET NO. R-2024-3047068

**Direct Testimony
of
Bill Wang**

List of Topics Addressed

**Capital Structure
Cost of Long-Term Debt
Weighted Average Cost of Capital**

TABLE OF CONTENTS

I.	INTRODUCTION AND PURPOSE	1
II.	CAPITAL STRUCTURE	3
III.	COST OF LONG-TERM DEBT	5
IV.	OVERALL COST OF CAPITAL.....	6
V.	CONCLUSION.....	6

**DIRECT TESTIMONY
OF
BILL WANG**

I. INTRODUCTION AND PURPOSE

Q. Please state your name and business address.

A. My name is Bill Wang. My business address is 76 South Main Street, Akron, Ohio 44308.

Q. By whom are you employed and in what capacity?

A. I am employed by FirstEnergy Service Company ("FESC") as Assistant Treasurer. I am responsible for managing pension investments of FirstEnergy Corp. ("FirstEnergy") and managing the capital structures for FirstEnergy and its subsidiaries, including FirstEnergy Pennsylvania Electric Company ("FE PA" or the "Company").

Q. Please describe your professional and educational background.

A. I joined Corning Incorporated ("Corning") as a Senior Financial Analyst in May 2001 after I received a Masters Business Administration from the Business School of University of Maryland in College Park. At Corning, I was part of the Treasury team, and participated in its capital structure management including various capital market transactions and banking relationship management. In July 2005, I joined Allegheny Energy, Inc., which merged with FirstEnergy in 2011. I was elected to my current position of Assistant Treasurer in 2016. Prior to that, I served in various Treasury positions including Director, Treasury Integration, and Director, Investment Management, managing FirstEnergy's and its subsidiaries' capital structures, \$12 billion asset investments related to FirstEnergy's Pension Plan, Savings Plan, and other post-retirements plans. I am also the Treasurer of FirstEnergy's New Jersey subsidiary, Jersey Central Power & Light Company since 2012.

1 **Q. Have you ever testified before the Pennsylvania Public Utility Commission**
2 **(“Commission”)?**

3 A. No, I have never testified before this Commission. I have, however, testified before the
4 Maryland Public Service Commission, New Jersey Board of Public Utilities, and the Public
5 Service Commission of West Virginia.

6 **Q. On whose behalf are you testifying in this proceeding?**

7 A. I am testifying on behalf of FE PA, formerly known as the individual Pennsylvania utility
8 operating companies Metropolitan Edison Company, Pennsylvania Electric Company,
9 Pennsylvania Power Company, and West Penn Power Company (collectively, the
10 “Predecessor Companies”).

11 **Q. What is the purpose of your direct testimony?**

12 A. My testimony describes and supports the capital structure, embedded cost of long-term
13 debt, and overall weighted average cost of capital claimed by FE PA.

14 **Q. Have you prepared any exhibits to accompany your testimony?**

15 A. Yes. I am sponsoring the following summary schedules for FE PA, which will be discussed
16 further in this testimony:

- 17 • FE PA Exhibit No. BW-1: Capitalization and Capitalization Ratios
- 18 • FE PA Exhibit No. BW-2: Schedule of Long-Term Debt Outstanding Projected
19 at December 31, 2025
- 20 • FE PA Exhibit No. BW-3: Overall Weighted Average Cost of Capital Projected
21 at December 31, 2025

1 Additionally, I am responsible for the Commission’s base rate filing requirements
2 II-B-5; III-A-1 through III-A-2; III-B-1 through III-B-5; III-C-1; III-D-2 through III-D-4;
3 III-E-1 through III-E-2; III-E-4; III-F-2 through III-F-4. Each of these exhibits or filing
4 requirements were prepared by me or under my supervision.

5 **II. CAPITAL STRUCTURE**

6 **Q. Please explain the steps FirstEnergy has taken in recent years to improve its balance**
7 **sheet.**

8 A. Since 2021, FirstEnergy has significantly improved its balance sheet by raising \$7 billion
9 dollars in equity capital. This includes a \$1 billion common equity transaction in late 2021,
10 a \$2.4 billion sale of a 19.9% equity interest in FirstEnergy Transmission, LLC (“FET”) in
11 2022, and an additional \$3.5 billion sale of a 30% equity interest in FET in first quarter of
12 2024. The equity transactions allowed FirstEnergy to reduce long-term debt as a
13 percentage of total debt to 26% at year-end 2023 versus 33% at year-end 2021. Also,
14 FirstEnergy plans to deploy \$450 million of the Q1 2024 FET sale proceeds to reduce long-
15 term debt at FE PA in 2024.

16 **Q. What capital structure ratio are you proposing be utilized for purposes of**
17 **determining overall weighted average cost of capital?**

18 A. I recommend using FE PA’s projected capital structure at December 31, 2025, exclusive
19 of short-term debt. That date corresponds to the end of the fully projected future test year
20 in this proceeding and, accordingly, reflects the mix of long-term debt and common equity
21 capital. See FE PA Exhibit No. BW-1 for the proposed capital structure.

1 **Q. Why are you proposing using FE PA’s capital structure instead of by rate district?**

2 A. On January 1, 2024, the Predecessor Companies merged into FE PA pursuant to the
3 Commission’s Order at Docket Nos. A-2023-3038771, et al (“PA Consolidation”). As part
4 of PA Consolidation, the tariffs of the Predecessor Companies were combined into a single
5 tariff for FE PA, which consists of the Met-Ed, Penelec, Penn Power, West Penn and
6 Pennsylvania State University (“PSU”) rate districts (individually a “Rate District” and in
7 any combination the “Rate Districts”).¹ Following the consummation of the merger
8 transaction, the existing long-term debt obligations of the Predecessor Companies, both
9 senior unsecured and secured (first mortgage bonds), became obligations of FE PA by
10 operation of law. Going forward, all refinancings of the Predecessor Companies debt and
11 new debt issuances will be done at FE PA.

12 **Q. Does this mean all of the Rate Districts have the same capital structure?**

13 A. Yes, that is correct.

14 **Q. Does FE PA have any preferred stock?**

15 A. No, FE PA does not have any preferred stock outstanding.

16 **Q. How did you derive the anticipated capital structure ratio at December 31, 2025?**

17 A. As set forth in FE PA Exhibit No. BW-1, the starting point was the actual capital structure
18 in place at December 31, 2023 for the Predecessor Companies, which represents the end of
19 the historic test year. Then, based on recent financial forecasts, the respective amounts of
20 long-term debt and common equity were projected forward to December 31, 2024, the end

¹ FE PA also has a sixth Rate District, the Waverly Rate District, which is not discussed directly in my testimony as it relates to FE PA’s New York jurisdictional rates.

of the future test year, and to December 31, 2025, the end of the fully projected future test year, to capture: (1) consummated and planned issuances of long-term debt; (2) the pay down of long-term debt; (3) the amortization of long-term debt discount; (4) planned equity infusions; and 5) anticipated changes in retained earnings.

Q. What specific capital structure ratio do you recommend be adopted for rate of return purposes in this case?

A. Since rate setting is prospective, the rate of return should reflect a utility's expected capital structure at the end of the fully projected future test year. Therefore, I recommend the adoption of the projected December 31, 2025, capital structure ratio of 46.2% long-term debt and 53.8% common equity.

III. COST OF LONG-TERM DEBT

Q. What cost rate have you assigned to the long-term debt component of FE PA capital structure?

A. The determination of a utility's weighted average long-term debt cost rate is essentially an arithmetic exercise due to the fact that the utility has contracted for the use of the capital in question for a defined period of time at a specified cost rate. The necessary calculations, which take into account issuance expense, are provided in FE PA Exhibit No. BW-2.

Q. Please describe what is shown in FE PA Exhibit No. BW-2.

A. FE PA Exhibit No. BW-2 itemizes each series of debt, the date of issuance, maturity, original amount issued and projected amount outstanding as of December 31, 2025. The Premium/Discount and Issuance Expenses column represents legal, underwriting and other miscellaneous costs associated with each issuance. The principal amount issued, adjusted

for any premium or discount, less any issuance expenses, equals the Net Proceeds. The effective rate is calculated by taking the Net Proceeds at the time of issuance and calculating the Internal Rate of Return based on the interest rate and the years to maturity. After the effective rate is calculated for each individual series, the rates are weighted by taking the effective rate multiplied by each respective amount outstanding divided by the total amount of long-term debt outstanding.

Q. What long-term debt cost rate do you recommend be utilized in developing FE PA's overall cost of capital?

A. As indicated in FE PA Exhibit No. BW-2, FE PA's projected weighted average long-term debt cost rate is 4.56%.

IV. OVERALL COST OF CAPITAL

Q. How did you calculate FE PA's overall cost of capital?

A. As set forth in FE PA Exhibit No. BW-2, I quantified and then combined FE PA's weighted average cost of long-term debt and common equity by multiplying the projected December 31, 2025 capitalization ratio presented in FE PA Exhibit No. BW-1 by: (1) the average cost of debt developed in FE PA Exhibit No. BW-2; and (2) FE PA's requested return on common equity of 11.30%. The proposed cost of equity is supported by Company witness D'Ascendis in FE PA Statement No. 10. FE PA's overall weighted cost of capital is 8.19%

V. CONCLUSION

Q. Does this conclude your testimony?

A. Yes, it does.
